

Determination of proton internal pressure: theoretical challenges

FunQCD | Hervé MOUTARDE

Apr. 01, 2021

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 824093.

Proton internal pressure

- Is it well-defined?
- Can it be measured?
- What are the needed theory inputs?

Deconvolution problem

Conclusion

- ### ■ Matrix element in the Breit frame ($a = q, g$):

$$\left\langle \frac{\Delta}{2} |T_a^{\mu\nu}(0)| - \frac{\Delta}{2} \right\rangle = M \left\{ \eta^{\mu 0} \eta^{\nu 0} \left[A_a(t) + \frac{t}{4M^2} B_a(t) \right] + \eta^{\mu\nu} \left[\bar{C}_a(t) - \frac{t}{M^2} C_a(t) \right] + \frac{\Delta^\mu \Delta^\nu}{M^2} C_a(t) \right\}$$

- ### ■ Anisotropic fluid in relativistic hydrodynamics:

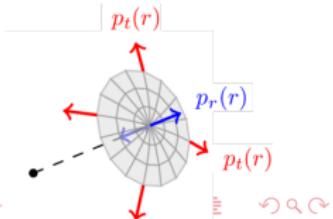

$$\Theta^{\mu\nu}(\vec{r}) = [\varepsilon(r) + p_t(r)] u^\mu u^\nu - p_t(r) \eta^{\mu\nu} + [p_r(r) - p_t(r)] \chi^\mu \chi^\nu$$

where u^μ and $\chi^\mu = x^\mu/r$.

- Define isotropic pressure and pressure anisotropy:

$$p(r) = \frac{p_r(r) + 2 p_t(r)}{3}$$

$$s(r) = p_r(r) - p_t(r)$$

Conclusion

Bjorken regime : large Q^2 and fixed $xB \simeq 2\xi/(1 + \xi)$

- Partonic interpretation relies on **factorization theorems**.
- All-order proofs for DVCS.
- GPDs depend on a (arbitrary) factorization scale μ_F .
- **Consistency** requires the study of **different channels**.
- GPDs enter DVCS through **Compton Form Factors** :

$$\mathcal{F}(\xi, t, Q^2) = \int_{-1}^1 dx T\left(x, \xi, \alpha_S(\mu_F), \frac{Q}{\mu_F}\right) F(x, \xi, t, \mu_F)$$

for a given GPD F .

- CFF \mathcal{F} is a **complex function**.

Conclusion

1 Expand D-term on Gegenbauer polynomials

$$D_{\text{term}}^q(z, t, \mu_F^2) = (1 - z^2) \sum_{\text{odd } n} d_n^q(t, \mu_F^2) C_n^{3/2}(z)$$

2 Write dispersion relation for CFF

$$\mathcal{C}_H(t, Q^2) = \text{Re}\mathcal{H}(\xi) - \frac{1}{\pi} \int_0^1 d\xi' \text{Im}\mathcal{H}(\xi) \left(\frac{1}{\xi - \xi'} - \frac{1}{\xi + \xi'} \right)$$

3 Compute subtraction constant

$$\mathcal{C}_H(t, Q^2) = 4 \sum_q e_q^2 \sum_{\text{odd } n} d_n^q(t, \mu_F^2 \equiv Q^2)$$

4 Retrieve gravitational form factor

$$d_1^q(t, \mu_F^2) = 5 C_q(t, \mu_F^2)$$

Almost all existing DVCS data sets. 2600+ measurements of 30 observables published during 2001-17.

Deconvolution problem

Conclusion

- No justification to truncate the subtraction constant expansion to its first term and assume that it is the d_1 coefficient related to the energy-momentum tensor.
- Shape of pressure profile is fixed by multipole Ansatz. Actual value is extremely sensitive to its parameters.

Dutrieux et al., arXiv:2101.03855 [hep-ph]

Phenomenology

CFF global fit

Pressure forces

Models: systematic uncertainties

Theoretical issues

Maximize theory input

Deconvolution problem

Conclusion

- Reduction to PDFs or elastic form factors.
- Implement *a priori* **positivity** and **polynomiality**. Still uncommon in many models or parameterizations used for phenomenology.
- **General solution** starting from overlap of (potentially effective) light front wave functions.
Chouika et al., Eur. Phys. J. C77, 906 (2017)
- Use of **evolution equations** to implement further constraints on the GPD functional form.
- Work **beyond leading-order** and depart from the parton model...
- Systematic impact study or use of **kinematic corrections** still missing.

problem

Conclusion

- Assume CFF \mathcal{H} is perfectly known. Solve inverse problem?

$$\mathcal{H}^q(\xi, Q^2) = \int_{-1}^1 \frac{dx}{\xi} T^q \left(\frac{x}{\xi}, \frac{Q^2}{\mu^2}, \alpha_s(\mu^2) \right) H^q(x, \xi, \mu^2)$$

- Question raised about 20 years ago and has remained essentially open. Evolution proposed as a crucial element.

Freund Phys. Lett. B472, 412 (2000)

- *In progress:* there exist **non-zero** GPDs with **vanishing forward limit** and **vanishing CFF** up to order α_s^2 .
- Consequence: the DVCS deconvolution problem is **ill-posed**.
- **Same conclusion holds** for several other hard exclusive processes.
- **Define and implement** further criterions in fitting strategies to select one solution among infinitely many.

Conclusion

- Concept **well-defined** and suitable for phenomenological analysis.
- Strong **first-principle connection** between concept and experimental data.
- The GPD deconvolution problem is **ill-posed**.
- **Huge sensitivity** to numerical noise or experimental uncertainties.
- Benefiting from new inputs or constraints from **nonperturbative QCD** is highly desirable!
