Obtain this 3d picture from DVCS / DVMP measurements ?

C. Weiss,  
AIP Conf.  
Proc. 1149,  
150 (2009)

# DVCS described by 4 Compton Form Factors.

Approximations : quark sector, leading twist and leading order.

- Example : GPD  $H$

$$\mathcal{H} = \int_{-1}^{+1} dx H(x, \xi, t) \left( \frac{1}{\xi - x - i\epsilon} - \frac{1}{\xi + x - i\epsilon} \right)$$

- Integration yields **real** and **imaginary** parts to  $\mathcal{H}$  :

## Compton Form Factor at Leading Order

$$Re\mathcal{H} = \mathcal{P} \int_{-1}^{+1} dx H(x, \xi, t) \left( \frac{1}{\xi - x} - \frac{1}{\xi + x} \right)$$

$$Im\mathcal{H} = \pi \left( H(\xi, \xi, t) - H(-\xi, \xi, t) \right)$$

- Similar relations for  $Re\mathcal{E}$ ,  $Im\mathcal{E}$ ,  $Re\tilde{\mathcal{H}}$ ,  $Im\tilde{\mathcal{H}}$ ,  $Re\tilde{\mathcal{E}}$  and  $Im\tilde{\mathcal{H}}$ .

Conclusions

## Local fits

Take each kinematic bin independantly of the others.

Extraction of  $\text{Re}\mathcal{H}$ ,  $\text{Im}\mathcal{H}$ , ... as independent parameters.

## Global fit

Take all kinematic bins at the same time. Use a  
parametrization of GPDs or CFFs.

## Hybrid : Local / global fit

Combine two previous methods to estimate model dependence.

## Neural networks

Already used ofr PDF fits. In progress for GPDs.

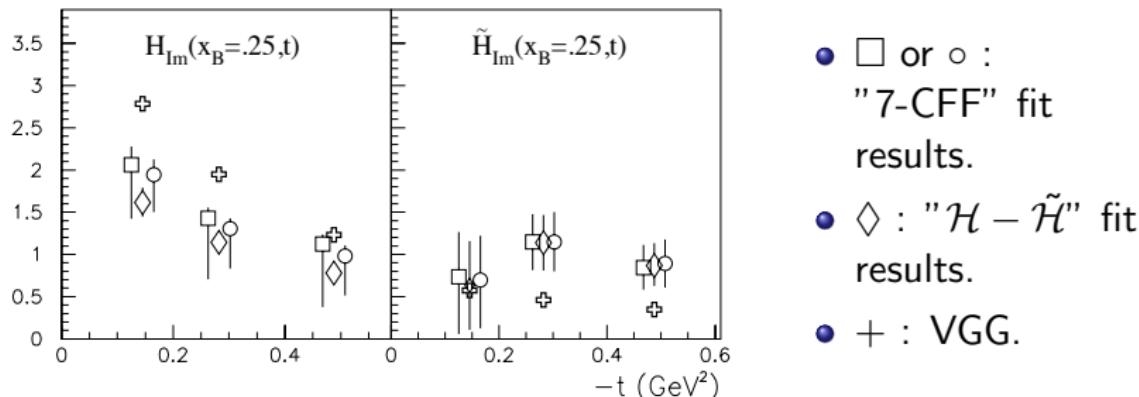

# Current extraction methods on the market.

Problems : Model dependence ? Degrees of freedom ?

## Local fits

Take each kinematic bin independantly of the others.

Extraction of  $Re\mathcal{H}$ ,  $Im\mathcal{H}$ , ... as independent parameters.

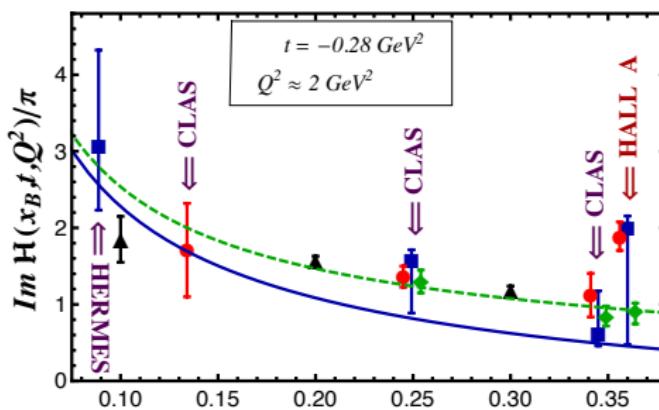

M. Guidal, Phys. Lett. B689 (2010) 156

# Current extraction methods on the market.

Problems : Model dependence ? Degrees of freedom ?

## Global fit

Take all kinematic bins at the same time. Use a parametrization of GPDs or CFFs.

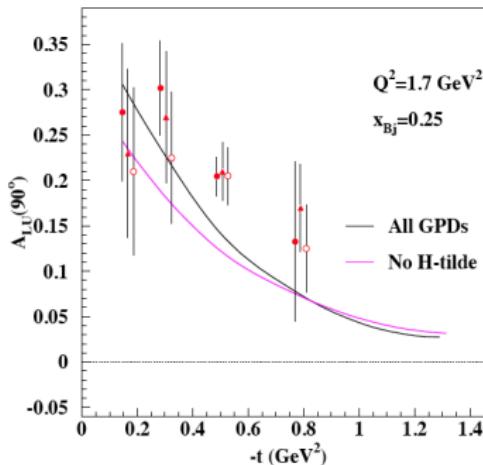

K. Kumericki and D. Müller, Exclusive 2010

# Current extraction methods on the market.

Problems : Model dependence ? Degrees of freedom ?

## Global fit

Take all kinematic bins at the same time. Use a parametrization of GPDs or CFFs.

- BSA at 90°.
- Test of  $\tilde{H}$  contribution.
- Negligible  $E$  contribution.

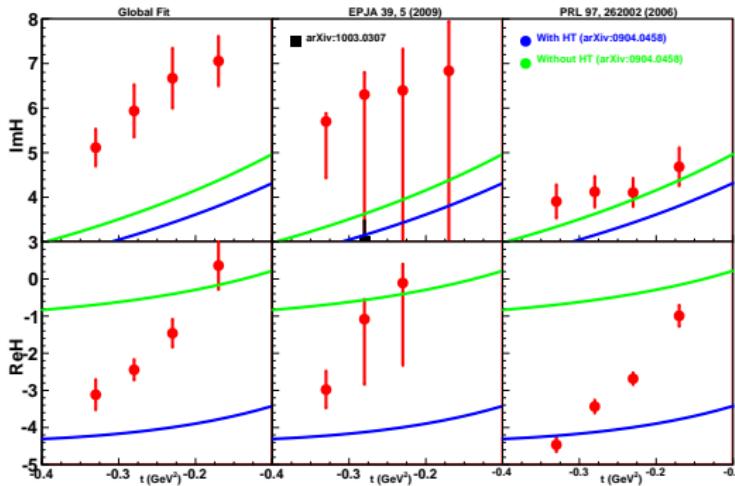

G. Goldstein *et al*, arXiv:1012.3776

# Current extraction methods on the market.

Problems : Model dependence ? Degrees of freedom ?

## Hybrid : Local / global fit

Combine two previous methods to estimate model dependence.

- Hybrid fit.
- Without Hall A data.
- With Hall A data.
- $\triangle$  : neural network.
- $\square$  : "7-CFF" fit results.

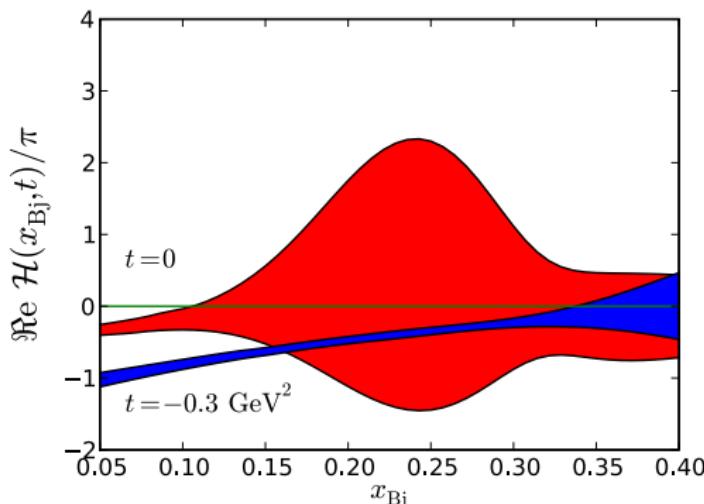

H. Moutarde, Phys. Rev. D79 (2009) 094021

# Current extraction methods on the market.

Problems : Model dependence ? Degrees of freedom ?

## Neural networks

Already used ofr PDF fits. In progress for GPDs.

- HERMES BCAs and CLAS BSAs.
- Extrapolation  $t \rightarrow 0$ .

First components  
Conclusions

- **Dominance** of twist 2 and **validity** of a GPD analysis of DVCS data.
- However a small **twist 3** contribution presumably exists.
- Already some indications about the validity of the  $H$ -dominance hypothesis.
- Cross-sections seem a bigger constraint to phenomenology than BSAs, looking forward to Hall B results.
- Question : What observable should be measured ?  
Accuracy ?

Conclusions

- $\chi^2/\text{dof} \simeq 7.63$  goes to 6.91 assuming more realistic 5 % uncertainty (statistical + systematic).
- **Fair agreement** with previous extractions of  $H$  at 6 GeV.
- Need careful analysis to see the (low) quality of the fit !
- Current hypothesis ( $H$ -dominance, ...) **no longer useable**.
- What observable should be measured ? **High precision asymmetries** seem a big constraint !

# Local fits.

Conclusions

- Structure of BSA in Guichon-Vanderhaeghen formalism :

$$\text{BSA} = \frac{a \sin \phi + b \sin 2\phi}{1 + c \cos \phi + d \cos 2\phi + e \cos 3\phi}$$

where

$$\begin{aligned} a &= \mathcal{O}(Q^{-1}) & d &= \mathcal{O}(Q^{-2}) \\ b &= \mathcal{O}(Q^{-4}) & e &= \mathcal{O}(Q^{-5}) \\ c &= \mathcal{O}(Q^{-1}) \end{aligned}$$

- Underconstrained** problem (8 fit parameters : real and imaginary parts of 4 CFFs  $\mathcal{H}$ ,  $\mathcal{E}$ ,  $\tilde{\mathcal{H}}$  and  $\tilde{\mathcal{E}}$ ).
- Need other asymmetries on **same** kinematic bin (or **add  $\simeq$  5-10 % systematic uncertainty**).

Conclusions

- **Encouraging first results** on extraction of GPDs from JLab measurements.
- Several points still need to be clarified :
  - **Universality**.
  - Precise impact of subdominant GPDs.
- The **12 GeV upgrade** will be more challenging and will put great constraints on phenomenology.
- Need of a robust and efficient **fitting strategy**.
- First steps in the development of a **platform dedicated to global GPD analysis**.
