

JOURNÉES DES THÉSARDS

Photometric selection of type Ia SNe in  
the SuperNova Legacy Survey:  
Improving the detection of transient  
events

Anais MÖLLER

Advisor: Vanina Ruhlmann-Kleider

# Who am I?

Universidad Simón Bolívar

Bac +5

Research project: quantum  
properties of a SU(2) model of the  
membrane

Internship

Photon plus jet cross section and  
purities in proton-proton collisions  
 $\sqrt{s} = 7$  TeV with the ATLAS detector

Internship

Data analysis on the SuperNova  
Legacy Survey

Theory

Particle physics

Cosmology

# My PhD

*Cosmologie* à l'aide des supernovae de type Ia (*SN Ia*) sélectionnées par *photométrie* dans l'expérience SNLS auprès du télescope Canada-France-Hawaii.

Supervisor: Vanina Ruhlmann-Kleider

○ *Cosmology*

! Dark energy

○ *Type Ia Supernovae*

! Detection

○ *Photometric SN Ia*

! No spectroscopy

# My **BIG** questions

Where is Waldo?  
(where are my SNIa?)

# My **BIG** questions

time

Where is Waldo?  
(where are my SNIa?)

! Efficiency

- detecting transient events
- detecting SNIa

! Good coordinate resolution

! Efficiently identifying SNIa only from photometry

! Doing cosmology with SNIa using photometric redshift:

Hubble diagram  $\rightarrow$  Measuring the expansion of the universe  $\rightarrow$  Equation of state of Dark Energy

# A brief morning breakfast "Cosmology" cereal

1998 measurements of **accelerated expansion** of the universe with distant **type Ia SNe**. (Perlmutter, Schmidt and Riess)

Why ?

Planck 2013

How do we measure expansion?

How do we **measure** distances?

Accelerating universe expansion . . .  
 not locally measurable  
 for the theorists: but "very" recent in cosmological scales

# Our distant standard: **SN Ia**

## Supernovae

- Very luminous **stellar explosions** (**transient** events).
- Types: **Ia** (thermonuclear) and Ib, Ic, II (core collapse).
- Homogeneous **spectral** and **photometric** properties.
- Similar luminosities → characteristic light curves!

**Standard Candles!**

# SuperNova Legacy Survey (SNLS)

- Canada-France-Hawaii Telescope in Hawaii
- MegaCam : 36 CCD mosaic
- 4 broadband filters
- 4 fields of 1 square degree

SNLS main goal: equation of state of Dark Energy!

- Observations: **2003-2008**

SNLS 3: first three years (G. Bazin 2011, Betoule 2014)

SNLS 5: all years

- **$0.2 < z < 1$**

We want to detect:

- a transient object
- with luminosity equivalent to the one of its host galaxy

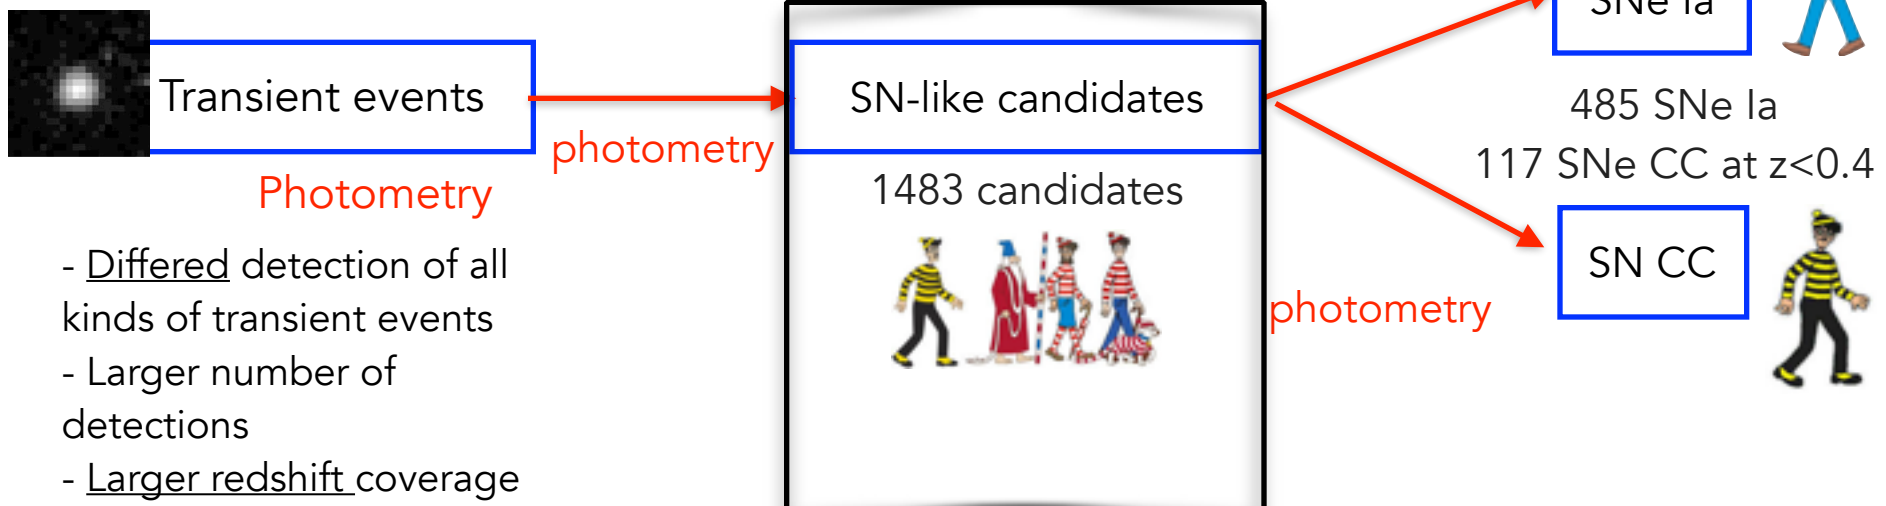

# SNLS analysis: standard vs. photometric

## Standard SNLS approach

## Saclay SNLS group: photometric approach, e.g. SNLS 3

before  
explosion

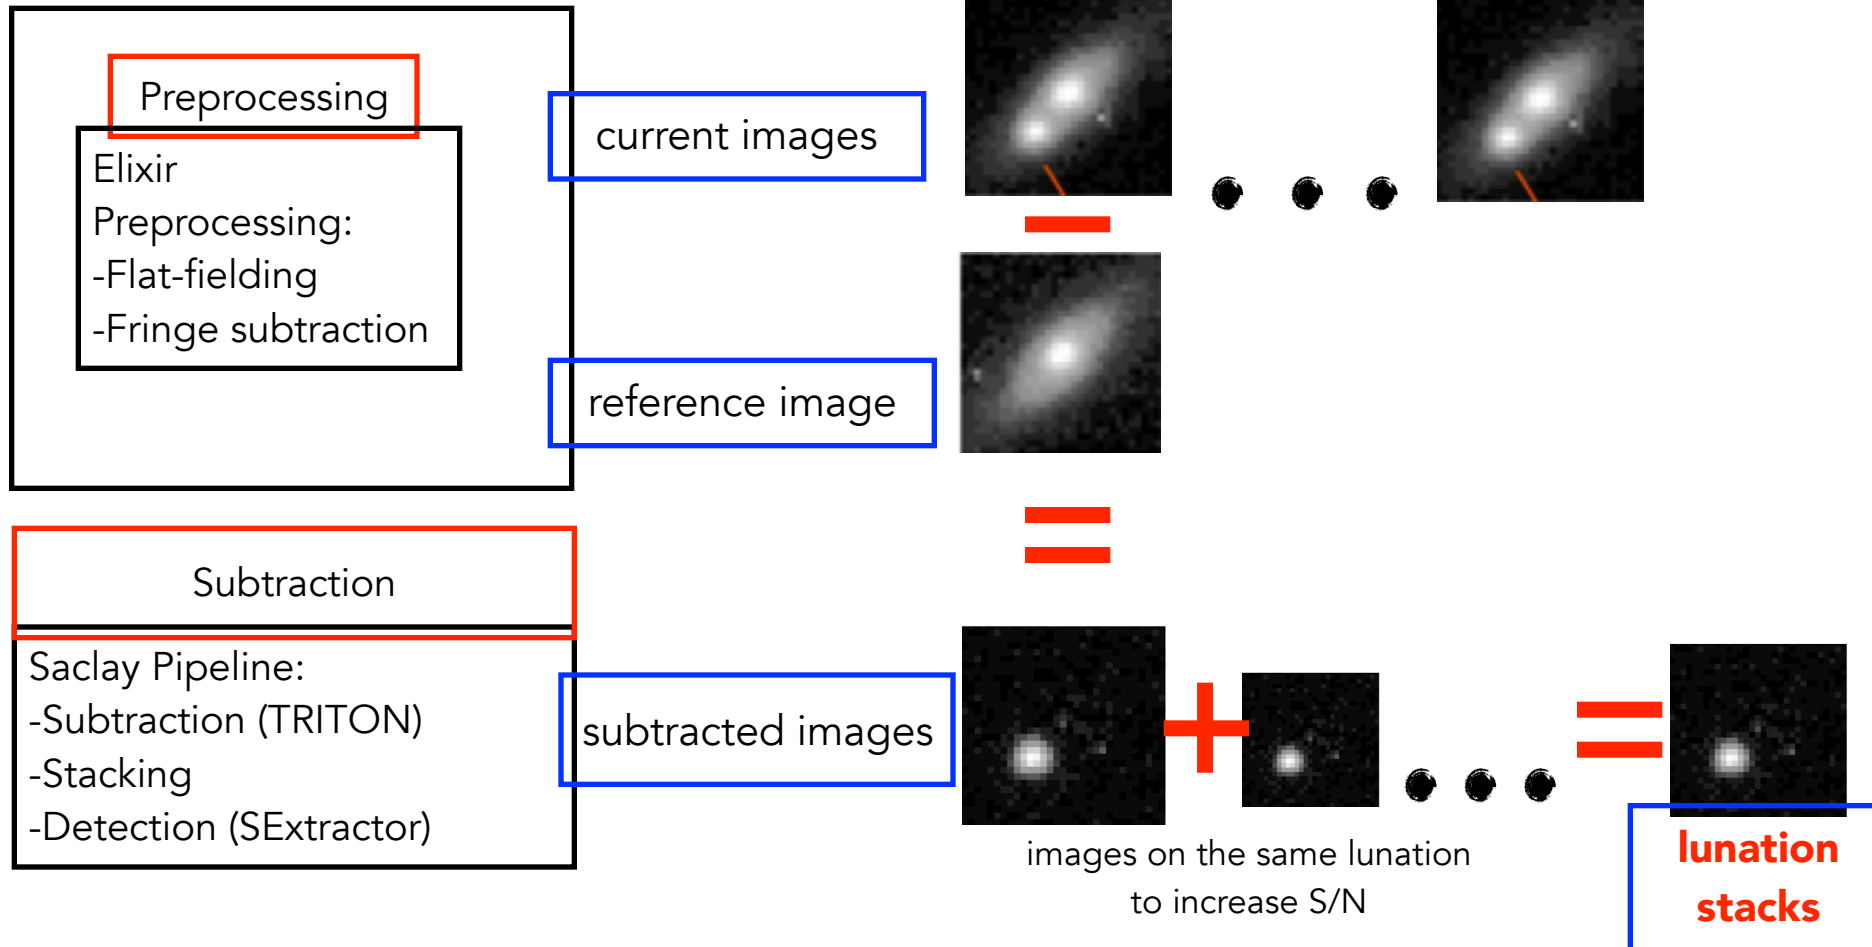

SN light curve

# Photometric detection

Transient events: Differentiate them from permanent objects

# Detection of transient events (a.k.a. "Waldo's gang") in SNLS-3y

**lunation  
stacks**

SN-like candidates  
+ spurious  
detections

test sample: field D4 detections 90,971

Sn-like 362

**4 fields @ 3-year processing**

Detections: 302,987

SN-like candidates: 1,483

# SNLS-3y photometric detection example

detection map

# Morphological Component Analysis

in collaboration with F. Lanusse and J-L. Starck from SAp, CEA

new method to reduce spurious detections at the lunation stack level

Hypothesis: a stack image can be decomposed completely in different "dictionaries"

An "**atom**": is the an elementary signal-representing template (e.g. a sine)

**Dictionary**: family of atoms that can be used to decompose a signal at different scales. (e.g. set of Sines at all frequencies)

We know some of the **defects** we have and which **type of signal an SN-type object** will be.

Search for "**circular shaped**" signals in the second or third **scales**

original image

wavelets

modified starlet  
bi-orthogonal

curvelet

ridgelet

# 1. First treatment

We adapted a code from Starck et al. that uses morphological decomposition at different scales to reduce spurious signals. And performed an optimisation of the code parameters.

*J.L. Starck, F. Murtagh, and J. Fadili, Sparse Image and Signal Processing: Wavelets, Curvelets, Morphological Diversity, Cambridge University Press, Cambridge (GB), 2010.*

## Characteristics

- Iterative
- Noise assumed stationary and gaussian
- Scales according to the transformation dictionary
- Support masks

## Dictionaries

- modified b3-spline isotropic undecimated wavelet
- bi-orthogonal wavelet
- curvelet
- ridgelet

## Noise map

- residuals

original stack

bi-orthogonal wt

ridgelet

modified starlet

curvelet

residuals

SN  
D4-16-95

## 2. Second treatment

*Accounting for non stationary and non gaussian noise*

- takes advantage once again of **morphological information** with wavelets only (first treatment decomposition is not perfect)
- supports **non stationary noise**
- no background in output image

original stack

snls\_detect output

All objects output by my second treatment are candidates

# Example, stack cleaning

D4 CCD 00 RUN 10

original stack tile

+ first treatment

+ second treatment

detections on ccd 00 and run 10:

**1597**

detections on ccd 00 and run 10:

**452**

# SNLS-3y after cleaning

Efficiency detecting transient events on SNLS 3

test sample: D4 **90,971**

test sample **after** treatment:

D4 **23,810**

✓ Efficiency detecting transient events on SNLS 3

**Almost factor 4 reduction!**

with loss of SN-like events of less than 6%

mostly very faint events not suitable for future cosmological analysis

# SN Ia MC studies

? Efficiency detecting SN Ia?

? Good coordinate resolution?

until now, **SNLS 3** studies: efficiency detecting transient events on real data

**SN Ia MC** using real survey images:

- Larger statistics
- Coordinates of the SN Ia are known (we can study coordinate resolution)
- Whole cleaning treatment applied.

✓ **Efficiency** detecting SN Ia?

Detection efficiency as a function of approx. min mag MC for 3rd year

original procedure

using two step  
treatment

# SN Ia MC studies

- ? Efficiency detecting SN Ia?
- ? Good coordinate resolution

## Coordinate reconstruction:

- Slight degradation from original to new procedure.
  - Distance RMS difference 0.03 pixels (0.006")
  - Magnitude bias increased by 2 milimag

original

our treatment

✓ Good **coordinate** resolution

# My **BIG** questions

time

Where is Waldo?  
(where are my SNIa?)

Efficiency

- detecting
- detecting

Good coordinate resolution

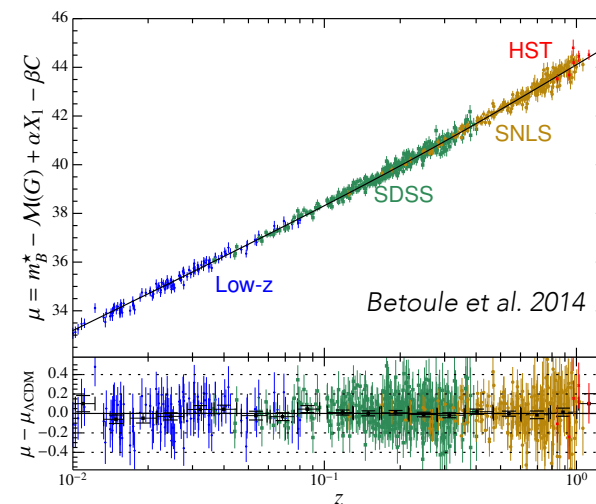

Efficiently identifying SNIa only from  
photometry

Doing cosmology with SNIa using photometric redshift:

Hubble diagram  $\rightarrow$  Measuring the expansion of the universe  $\rightarrow$  Equation of state of Dark Energy

D4 19 475 SNIa  $z_{\text{spe}}=0.37$

# Summary and forecast

## SNLS 5

- Ongoing processing
- Catalog of transient event candidates:
  - Before treatment : 575,857
  - After treatment : 142,484
- **Next:**
  - Selecting type Ia SN events with:
    - host photometric redshift (SNLS 3)
    - SN photometric redshift
  - Hubble diagrams for these

**“Dude...  
I’m right here”**

Future publication of this work...
