

Study of the diboson $ZZ \rightarrow 4l$ production with the ATLAS detector

Journées Thésards SPP/IRFU- 2ème année

1-2 July 2013

Protopapadaki Sofia

PhD supervisor : J-F Laporte

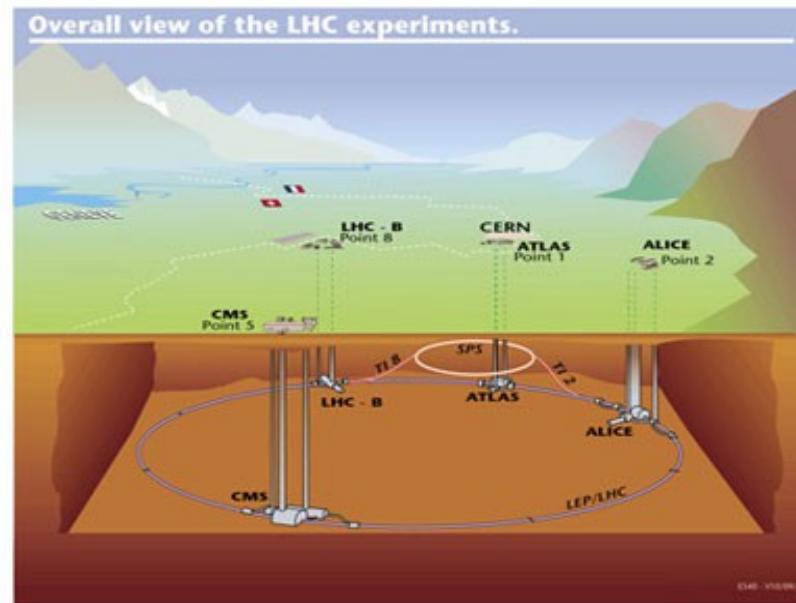

Outline

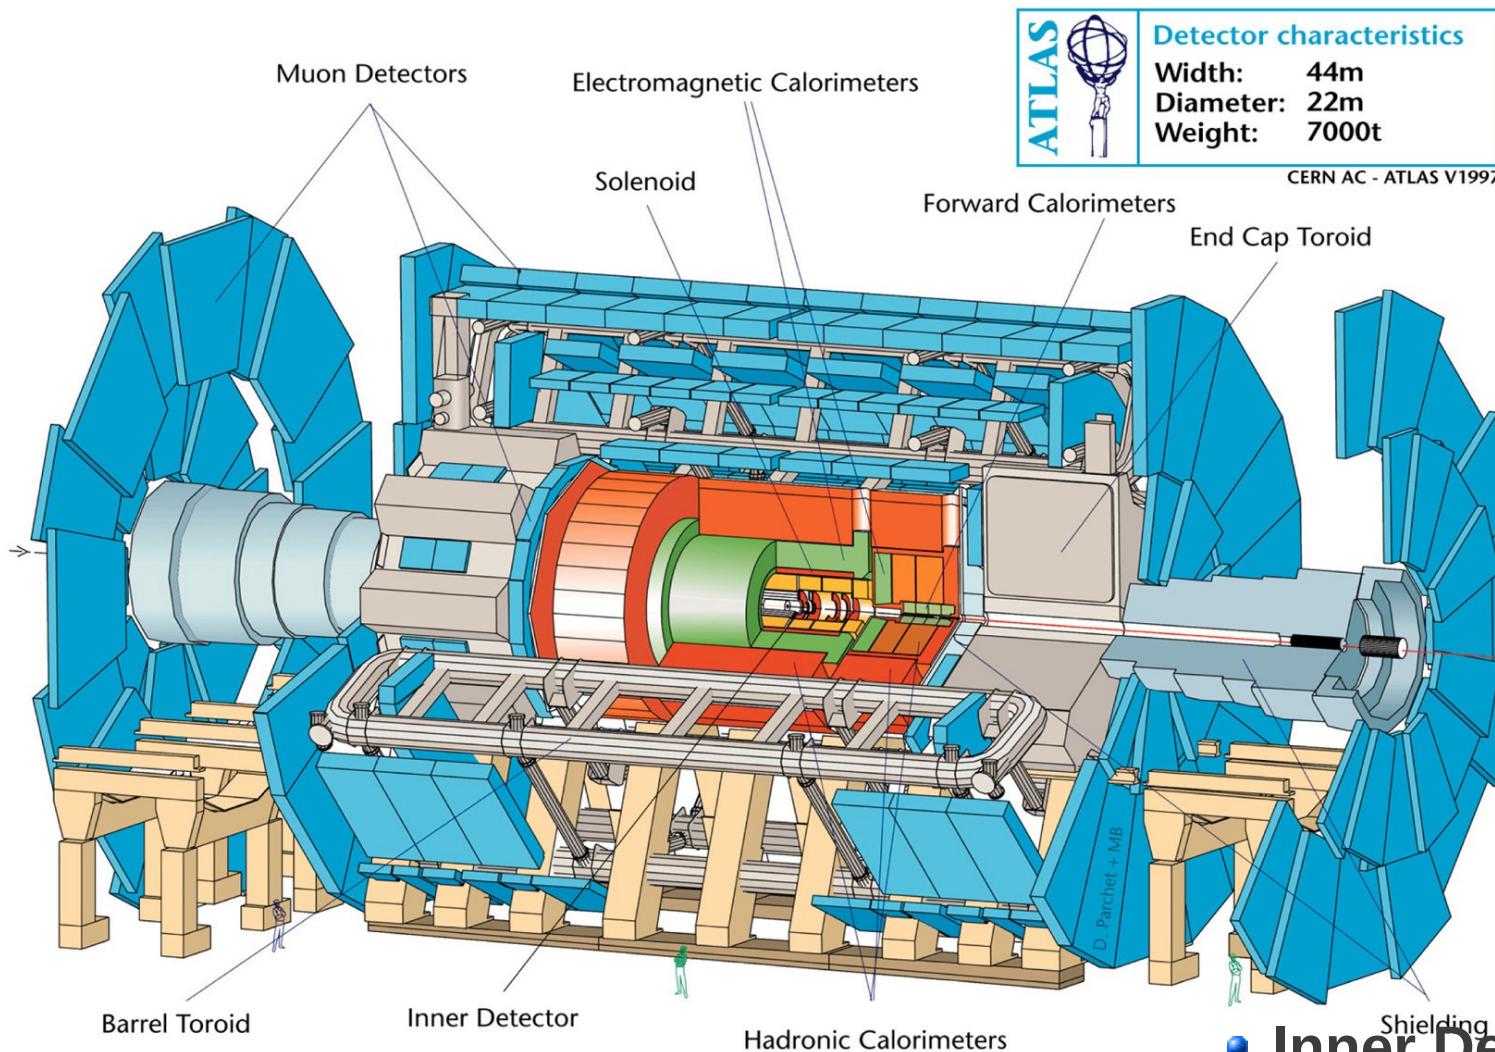

- The LHC and the ATLAS Detector
 - Muon spectrometer and qualification task
- ZZ Analysis :
 - Physics and motivations
 - Selection & Background
 - Cross section extraction
 - Limits on Neutral triple gauge coupling (TGC)

The LHC

- Ring of 27 Km near Geneva
- p-p collisions at CME 8TeV
- 4 Big experiments

The ATLAS Detector

Detector characteristics

Width: 44m
Diameter: 22m
Weight: 7000t

CERN AC - ATLAS V1997

- **Inner Detector**
- **Electromagnetic calorim.**
- **Hadronic calorimeter**
- **Muon spectrometer**

Muon Spectrometer & magnetic field

Toroidal magnetic field ~0.5 T

Allows to:

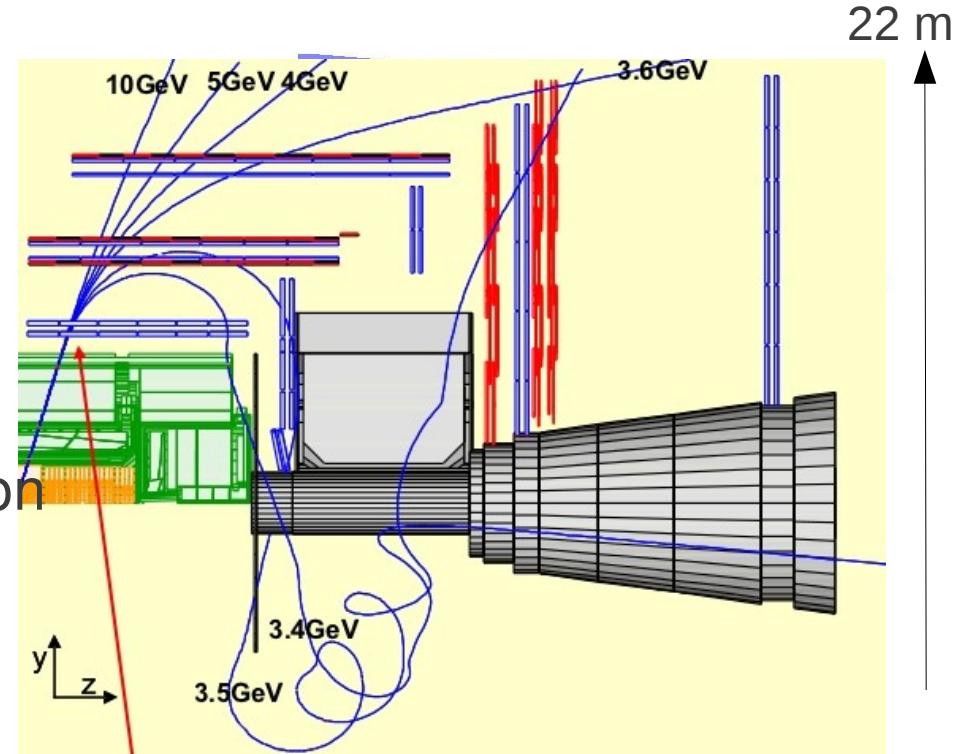

- 1) Identify muons charge
- 2) Determine muon momentum

→ Has to be **modeled** for the reconstruction procedure: Magnetic field map (B-map)

Service task (~6 months work):

- For the magnetic field reconstruction: ~1700 magnetic field sensors
→ Sensor stability → classification
- Study of agreement between B-map prediction and sensors measurement
- Investigation of observed fluctuations in the measured magnetic field

CDS address : <https://cds.cern.ch/record/1495223?>

Physics Analysis

Analysis Introduction

- The Standard Model :

- ★ Electroweak sector:

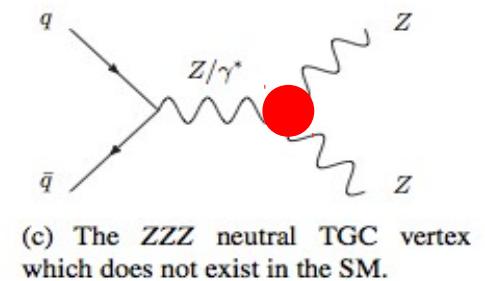

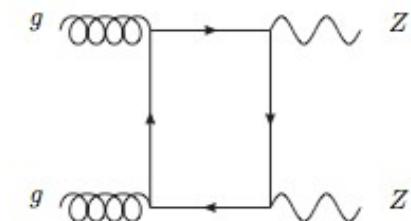

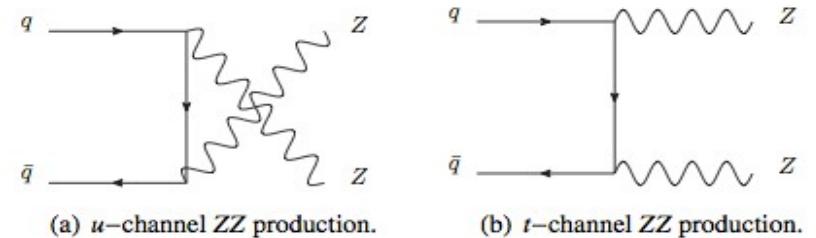

$SU(2)_L \times U(1)_Y$ non-abelian gauge group

- ★ Neutral Triple Gauge Couplings predicted to be 0 (c)
but can be introduced using an effective Lagrangian

$$\mathcal{L}_{VZZ} = -\frac{e}{M_Z^2} [f_4^V (\partial_\mu V^{\mu\beta}) Z_\alpha (\partial^\alpha Z_\beta) + f_5^V (\partial^\sigma V_{\sigma\mu}) \tilde{Z}^{\mu\beta} Z_\beta]$$

- Motivation

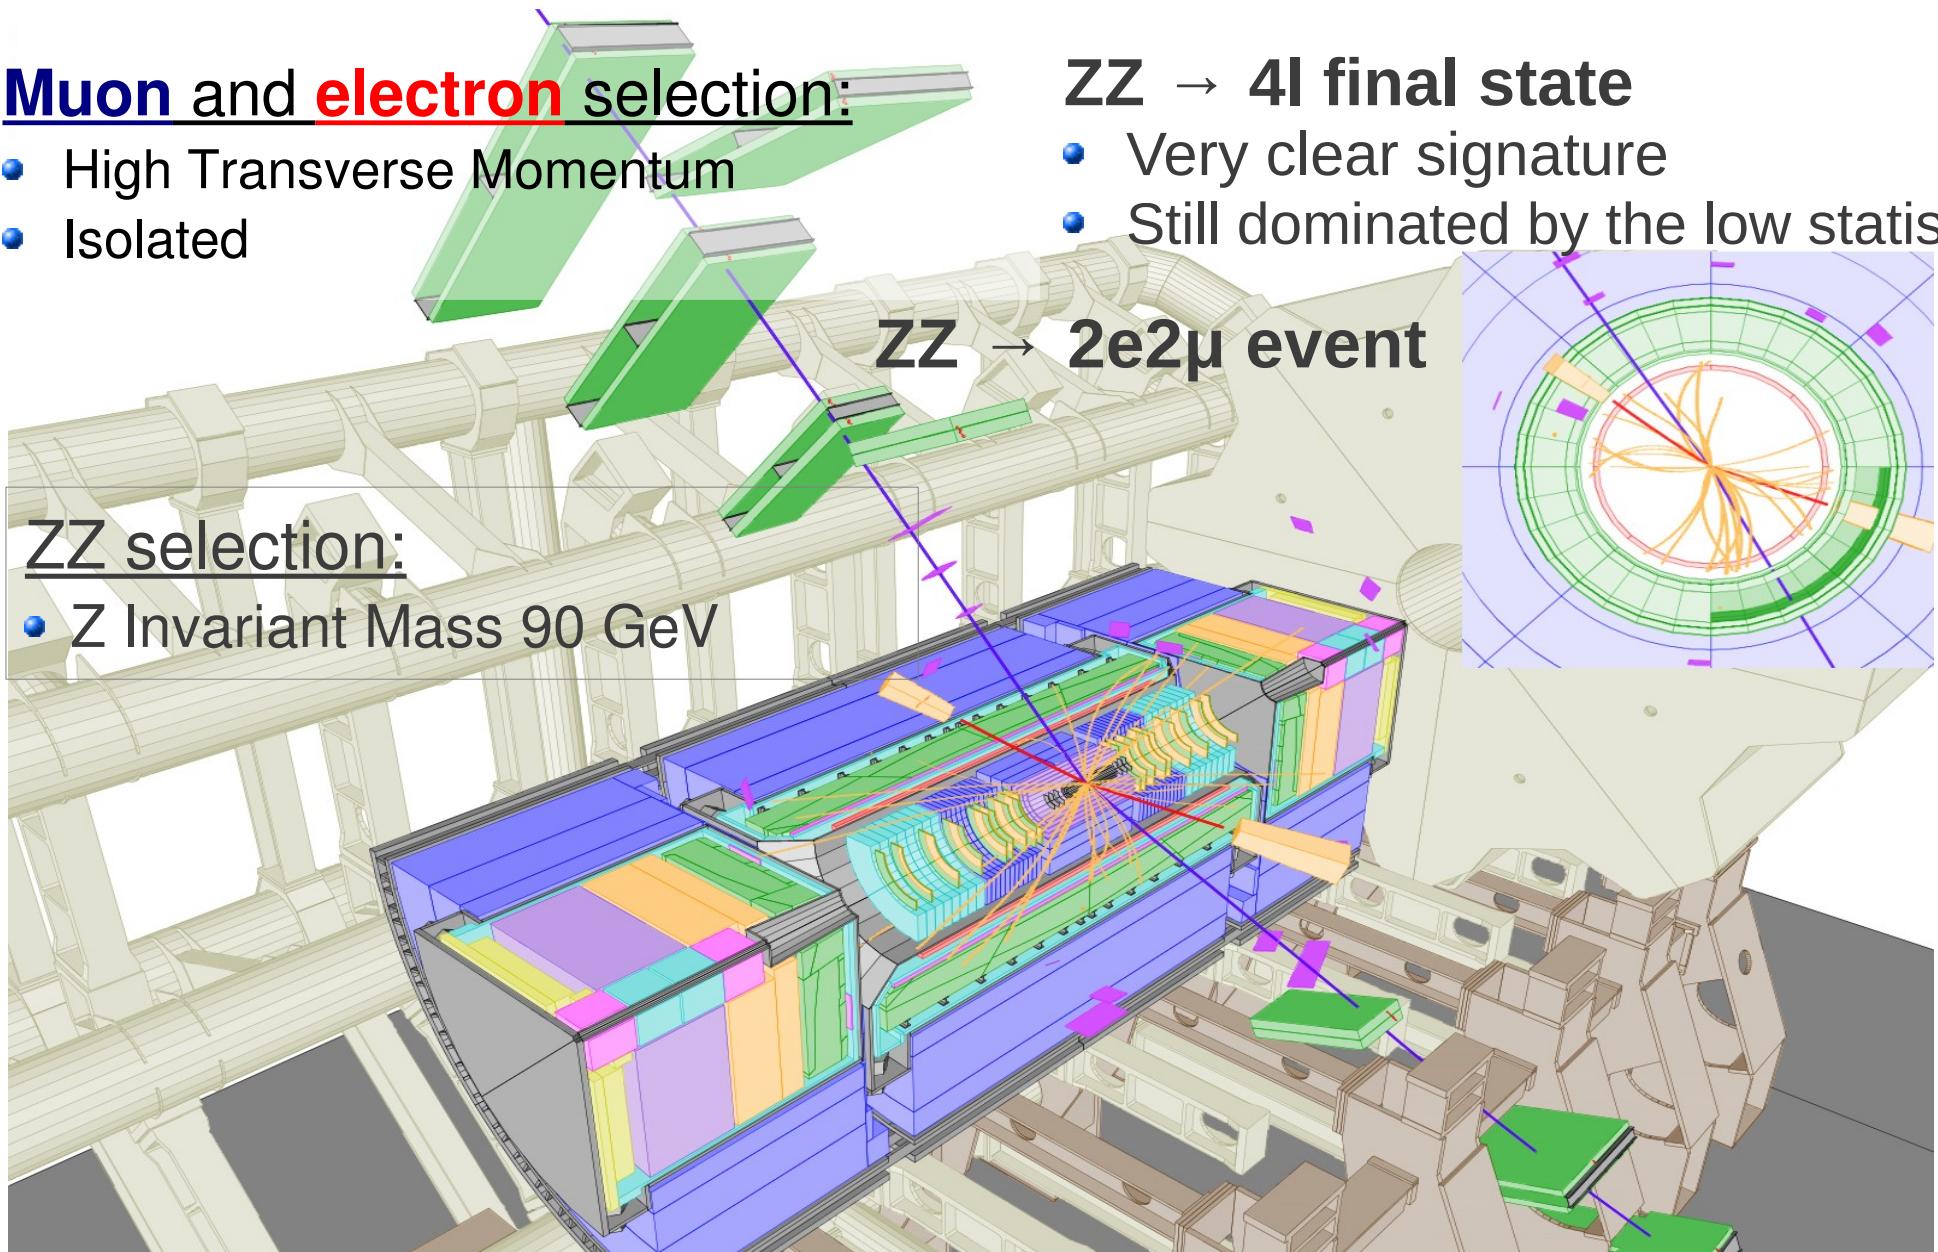

- Now enough CME and luminosity for precise ZZZ measurement
- Probe standard model (TGC: new physics)
- Main irreducible background to Higgs

Event selection

Muon and **electron** selection:

- High Transverse Momentum
- Isolated

$ZZ \rightarrow 4l$ final state

- Very clear signature
- Still dominated by the low statistics

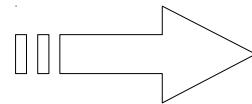

ZZ selection:

- Z Invariant Mass 90 GeV

Background estimation

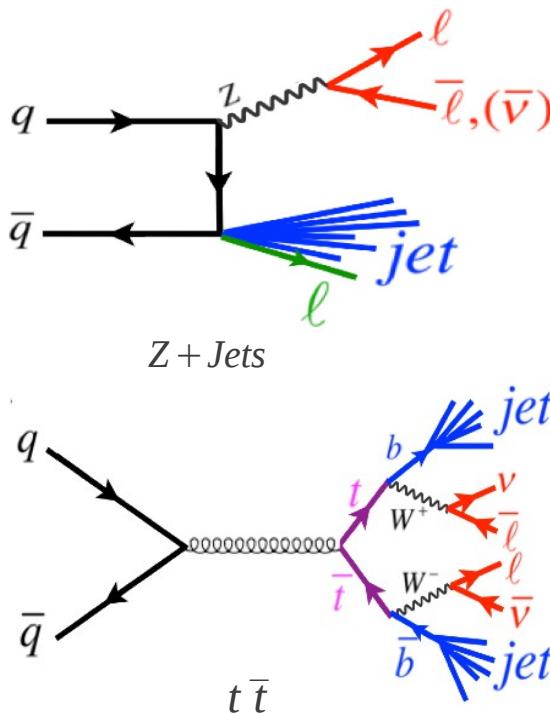

1) Reducible background (fake leptons) :

- $Z+X$ (jet or γ)
- Top (single top or $t\bar{t}$)
- $WZ/WW + \text{jets}$

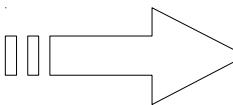

Fully Data Driven estimation :

- ★ Use data to estimate the number of Background contamination in our selection

2) Irreducible background (all 4 true leptons):

- $t\bar{t} + Z$
- ZVV

Estimated from
Monte Carlo

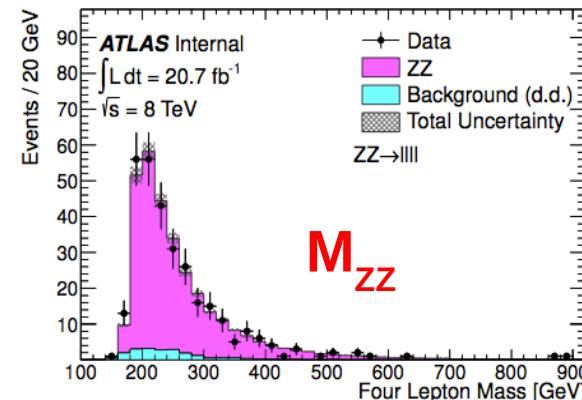

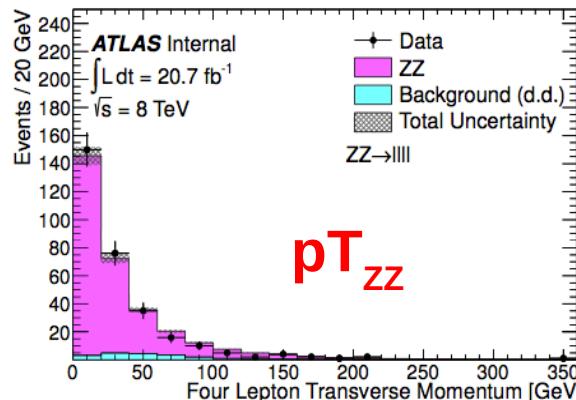

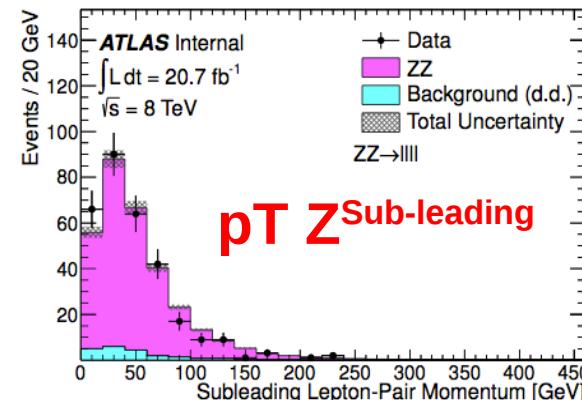

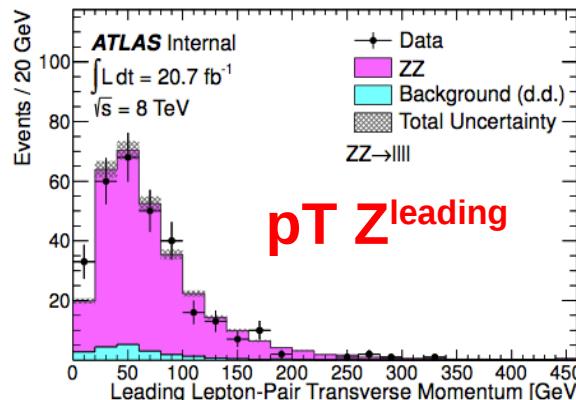

Observed events and kinematic distributions

→ Results using all 2012 data at a CME = 8TeV

$ZZ \rightarrow \ell\ell\ell'\ell'$	$e^+e^-e^+e^-$	$\mu^+\mu^-\mu^+\mu^-$	$e^+e^-\mu^+\mu^-$	$\ell^+\ell^-\ell'^+\ell'^-$
Observed ZZ	62	85	158	305
Expected ZZ	$59.53 \pm 0.46 \pm 3.95$	$90.23 \pm 0.59 \pm 2.68$	$142.71 \pm 1.04 \pm 5.54$	$292.47 \pm 1.28 \pm 10.53$
Expected Bkg ZZ	$10.04 \pm 1.75 \pm 1.41$	$1.06 \pm 1.42 \pm 0.45$	$9.25 \pm 2.08 \pm 3.11$	$20.35 \pm 2.91 \pm 4.96$

312

Good Data - MC
Agreement!

Cross-section extraction

Total cross section :

$$\sigma_{ZZ}^{tot} = \frac{N_{llll}^{obs} - N_{llll}^{bkrg}}{L \times BR(ZZ \rightarrow llll) \times A_{ZZ \rightarrow llll} \times C_{ZZ \rightarrow llll}}$$

- L : Luminosity
- BR : Branching ratio $ZZ \rightarrow 4l$
- $A_{ZZ \rightarrow llll}$: Corrects for detector acceptance
- $C_{ZZ \rightarrow llll}$: Corrects for detector efficiency

$$\sigma_{ZZ}^{tot} = 7.1^{+0.5}_{-0.4} (stat) \pm 0.3 (syst) \pm 0.2 (lumi) pb$$

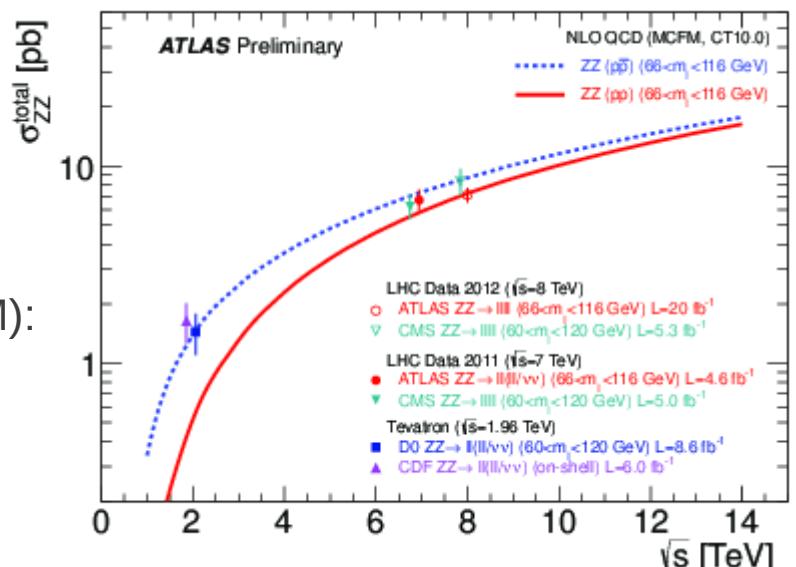

To be compared with the theoretical NLO prediction (MCFM):

$$\sigma_{ZZ}^{tot} = 7.2^{+0.3}_{-0.2} pb$$

→ Statistics still low

Systematic uncertainties :

- Object uncertainties $\sim 3.3\%$:
 - Lepton energy calibration
 - Reconstruction & identification
- Theoretical uncertainties $\sim 1\%$
- Luminosity 2.8%

Results shown in the Moriond 2013 conference

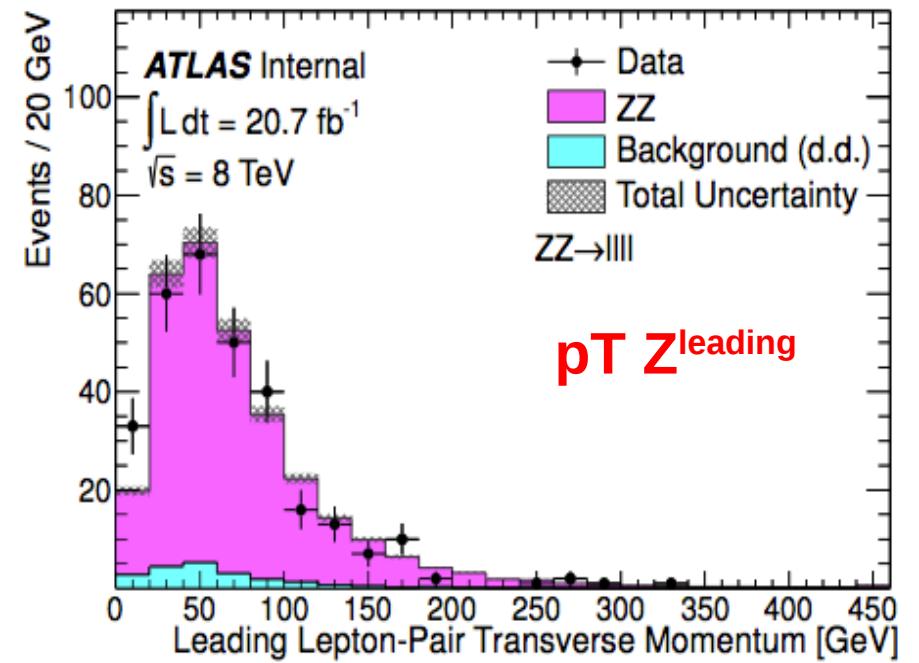

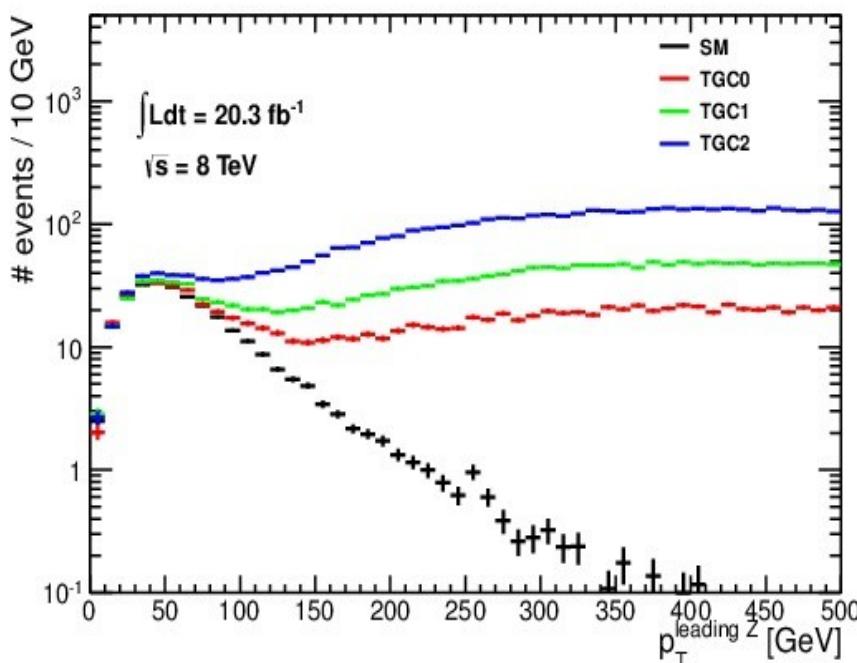

Conference Note : ATLAS-COM-CONF-2013-020
<https://cds.cern.ch/record/1517443>

aTGC limits

- Parametrize signal as a function of the 4 couplings:

$$N_{expected}(f_4^y, f_4^Z, f_5^y, f_5^Z)$$

- aTGC sensitivity in hight Z^{leading} Pt bins

Limits fitting each coupling separately

7TeV results :

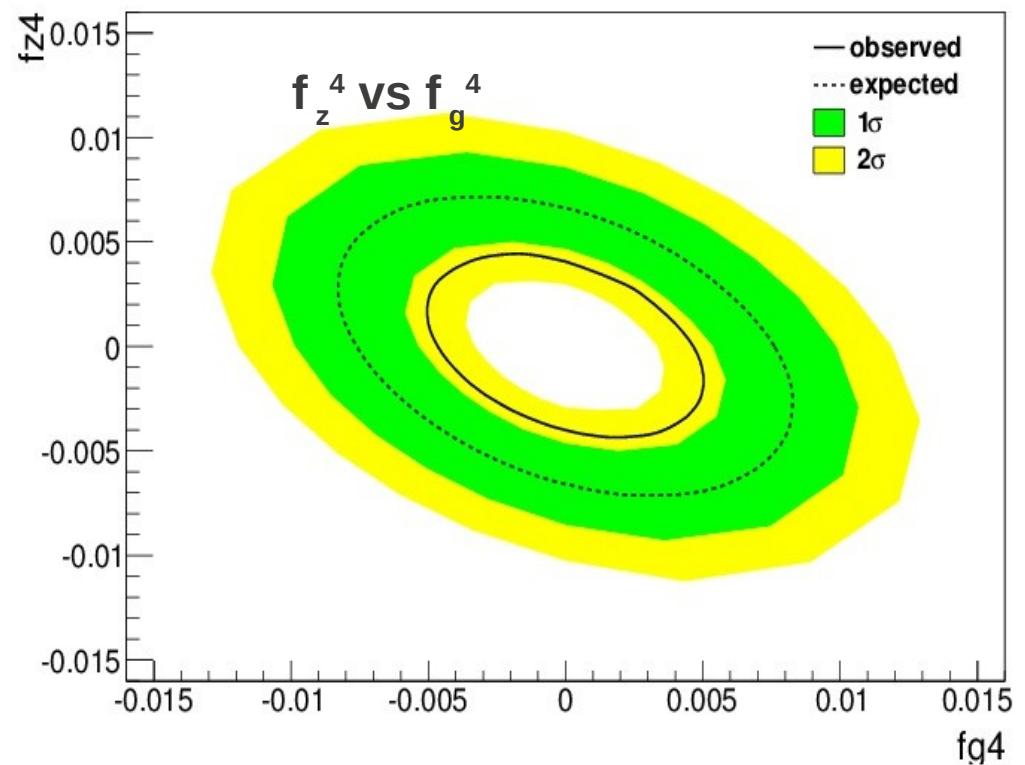

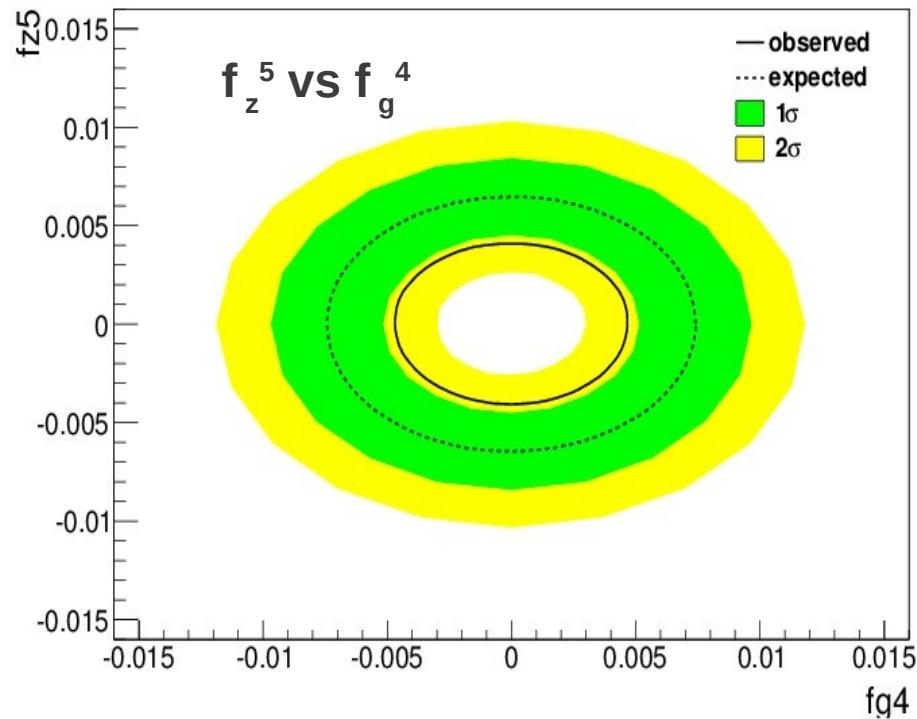

4 Z p_T bins	expected	$[-0.017, 0.017] \pm 0.005$	$[-0.015, 0.015] \pm 0.004$	$[-0.017, 0.017] \pm 0.005$	$[-0.015, 0.015] \pm 0.004$
	observed	$[-0.020, 0.020]$	$[-0.017, 0.017]$	$[-0.020, 0.020]$	$[-0.017, 0.017]$

8TeV results :

	Expected limits	Observed limits
f_4^γ	$[-0.008 ; 0.007] \pm 0.002$	$[-0.005; 0.005]$
f_4^Z	$[-0.006 ; 0.006] \pm 0.002$	$[-0.004; 0.004]$
f_5^γ	$[-0.007 ; 0.007] \pm 0.002$	$[-0.005; 0.005]$
f_5^Z	$[-0.006 ; 0.006] \pm 0.002$	$[-0.004; 0.004]$

- 8TeV limits, as expected, tighter than 7TeV
- Analysis optimization ongoing!

Limits fitting simultaneously two couplings

- Observed limits in 2 sigma band
- Same image for all 6 pairs of couplings

Conclusion

- During the first year worked on service task
 - An internal note was written
- Cross section measurement with 2012 data : 7.1 ± 0.6 bp
 - In agreement with theory: 7.2 ± 0.4 pb
 - Results presented at the moriond conference
- First look at aTGC limits
 - Limits using 2012 data significantly tighter
 - A paper should be published by the beginning of Autumn

Back up

→ Determine cross-sections with a log-likelihood fit with Gaussian nuisance parameters:

$$-\ln L = \sum_{i=0}^{n_{bins}} -\ln \frac{N_{\text{exp}}^{i N_{\text{obs}}^i} e^{-N_{\text{exp}}^i}}{N_{\text{obs}}^i!} + \sum \frac{x_k^2}{2}$$

→ Nexp aTGC parametrisation

$$\begin{aligned} N_{\text{expected}} = & Y_{00} + f_4^y Y_{01} + f_4^z Y_{02} + f_5^y Y_{03} + f_5^z Y_{04} \\ & + (f_4^y)^2 Y_{11} + f_4^y f_4^z Y_{12} + f_4^y f_5^y Y_{13} + f_4^y f_5^z Y_{14} \\ & + (f_4^z)^2 Y_{22} + f_4^z f_5^y Y_{23} + f_4^z f_5^z Y_{24} \\ & + (f_5^y)^2 Y_{33} + f_5^y f_5^z Y_{34} \\ & + (f_5^z)^2 Y_{44} \end{aligned}$$
