Mechanisms of accretion

Formation of largest structure in the universe

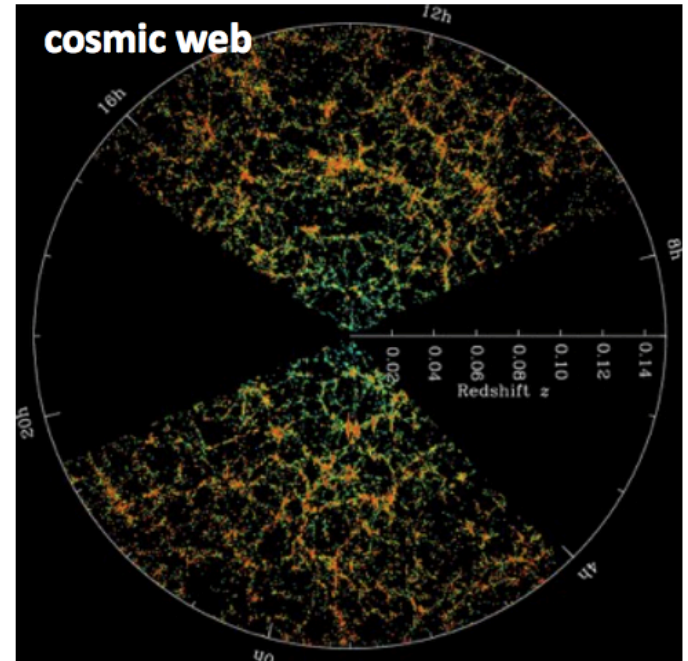

Gaussian primordial fluctuations

gravity

expansion

Concordance model

Key ingredients (simplified) :

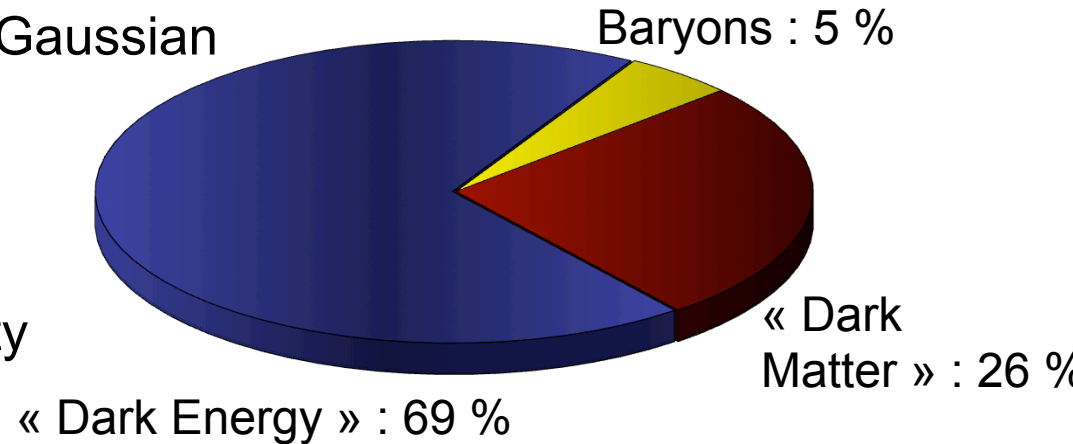

- Inflation produces a scale invariant perturbation spectrum : initial Gaussian fluctuations
 - **Assumes General Relativity**
 - Baryon density
 - Cold dark mater (CDM) density
 - Dark energy (L) density
- **Cosmological constant**

3. Testing the underlying theory of gravitation with large-scale structures

Pauline Zarrouk, Etienne Burtin
CEA/Irfu/DPhP

DATA: Quasars as tracers of the matter distribution in the sky

- Super-massive black hole at the center of some galaxies
- Very bright (~ 100 galaxies)
- Very massive (1 million times the Sun)
- Point-source (different from stars)

- Sample: more than 147, 000 quasars formed more than 6 billion years ago

→ Map the large-scale structures in the universe with the positions of quasars, the brightest objects in the sky

THE TECHNIQUE: Spatial correlation of pairs of quasars

Correlation function ξ

$$dP = \bar{\rho}(r) dV_1 dV_2 [1 + \xi(r)]$$

THE TECHNIQUE: Spatial correlation of pairs of quasars

Correlation function ξ

$$dP = \bar{\rho}(r) dV_1 dV_2 [1 + \xi(r)]$$

$$dV_2 \quad \mathbf{s} = \mathbf{r} + \mathbf{v}(r) \cdot \mathbf{u}_{\text{LOS}}$$

MEASUREMENT: Growth rate of structures

→ The shape of the correlation function depends on cosmological parameters

1. General relativity predicts how many structures have been formed at a given epoch of the universe:

$$f(z) = \Omega_m(z)^{\gamma=0.55}$$

MEASUREMENT: Growth rate of structures

→ The shape of the correlation function depends on cosmological parameters

1. General relativity predicts how many structures have been formed at a given epoch of the universe:

$$f(z) = \Omega_m(z)^{\gamma=0.55}$$

2. I am measuring this parameter with the eBOSS quasar sample.

MEASUREMENT: Growth rate of structures

→ The shape of the correlation function depends on cosmological parameters

1. General relativity predicts how many structures have been formed at a given epoch of the universe:

$$f(z) = \Omega_m(z)^{\gamma=0.55}$$

2. I am measuring this parameter with the eBOSS quasar sample.

3. Constrain general relativity and rule out different scenarios for the acceleration of the expansion.

MEASUREMENT: Growth rate of structures

→ The shape of the correlation function depends on cosmological parameters

1. General relativity predicts how many structures have been formed at a given epoch of the universe:

$$f(z) = \Omega_m(z)^{\gamma=0.55}$$

2. I am measuring this parameter with the eBOSS quasar sample.

3. Constrain general relativity and rule out different scenarios for the acceleration of the expansion.

First measurement of the growth rate of structures at redshift ~ 1.5 using the eBOSS DR14 quasar sample

P. Zarrouk, E. Burtin et al. (2017a in prep)

MEASUREMENT: Growth rate of structures

→ The shape of the correlation function depends on cosmological parameters

- **eBOSS forecast for the quasar sample:** ~4% precision with 6 years data taking
- **DESI* (2018) and Euclid* (2021):** subpercent precision on cosmological parameters

* Ifu active in both projects

First measurement of the growth rate of structures at redshift ~ 1.5 using the eBOSS DR14 quasar sample

P. Zarrouk, E. Burtin et al. (2017a in prep)

SUMMARY AND PERSPECTIVES

- **2 years data taking of eBOSS: more than 147,000 quasars spectra**
 - Biggest sample of the brightest objects in the sky used to map the largest structures of the universe
 - CEA/CNRS press release following the SDSS press release: Metin Ata *et. al.*, <https://arxiv.org/abs/1705.06373>
- **First measurement of the growth rate of structures in the eBOSS quasar sample** (P. Zarrouk, E. Burtin et al. 2017a in prep)
 - Unique and direct test of general relativity, the underlying theory of gravitation
 - Powerful discriminant between different dark energy scenarios
- **Ongoing analysis: Collaboration with IPhT to constrain different alternatives to the concordance model**
- **Ongoing analysis: Mock challenge**

4. Testing an alternative theory of gravitation with the very young universe

- Relativistic theory of gravitation

The Universe expansion

Einstein completes the theory of General Relativity
1915

- Relativistic theory of gravitation
- Dynamics given by :

$$G_{\mu\nu} = \frac{T_{\mu\nu}}{M_P^2} \Leftrightarrow \mathcal{S} = \frac{M_P^2}{2} \int d^4x \sqrt{-g} R$$

The Universe expansion

The Universe expansion

- Need to add a cosmological constant Λ to get a static Universe :

$$G_{\mu\nu} + \Lambda g_{\mu\nu} = \frac{T_{\mu\nu}}{M_P^2} \Leftrightarrow \mathcal{S} = \frac{M_P^2}{2} \int d^4x \sqrt{-g} (R - 2\Lambda)$$

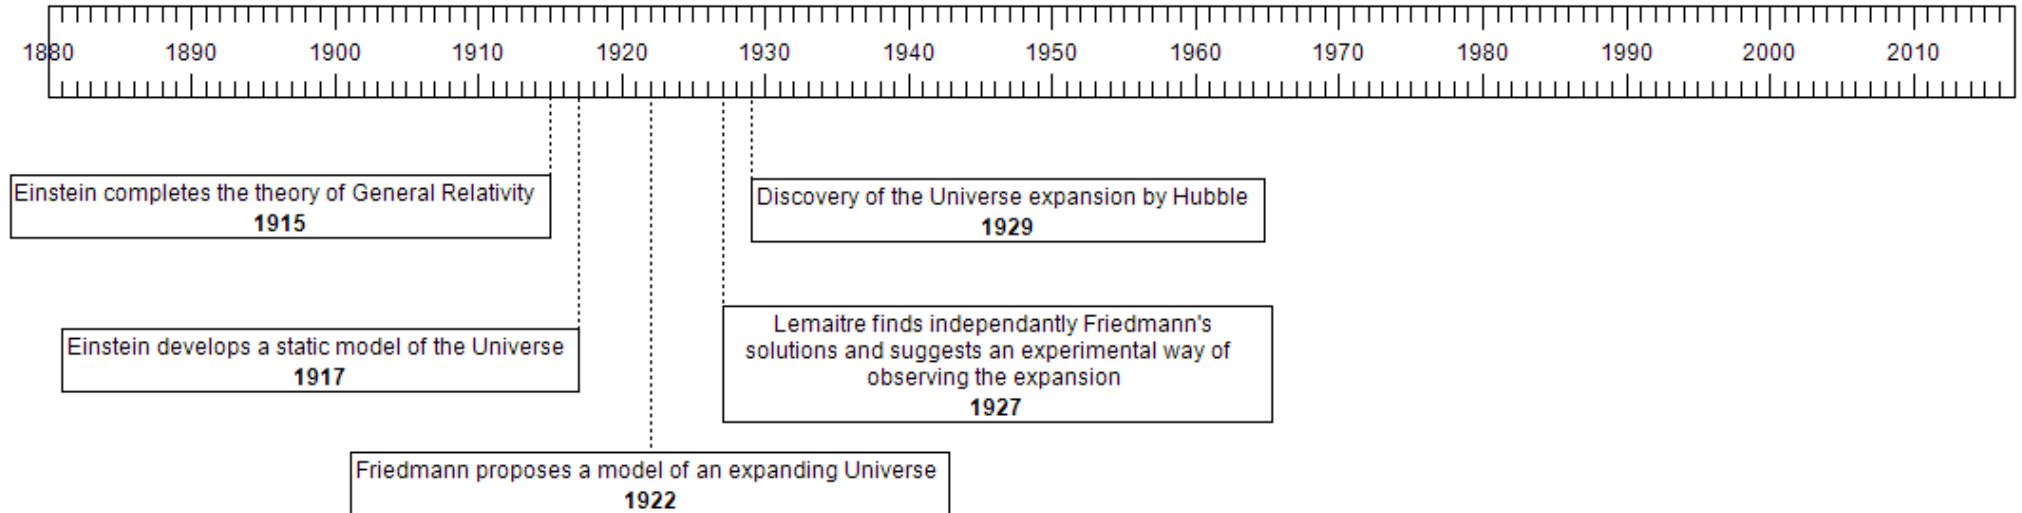

The Universe expansion

The Universe expansion

- Universe not static, no need for Λ

The Universe expansion

- Universe not static, no need for Λ
- The Universe expansion

follows :
$$\left(\frac{da}{dt}\right)^2 = \frac{\kappa\rho_0}{3a(t)} - K$$

The Universe expansion

➤ Universe not static, no need for Λ

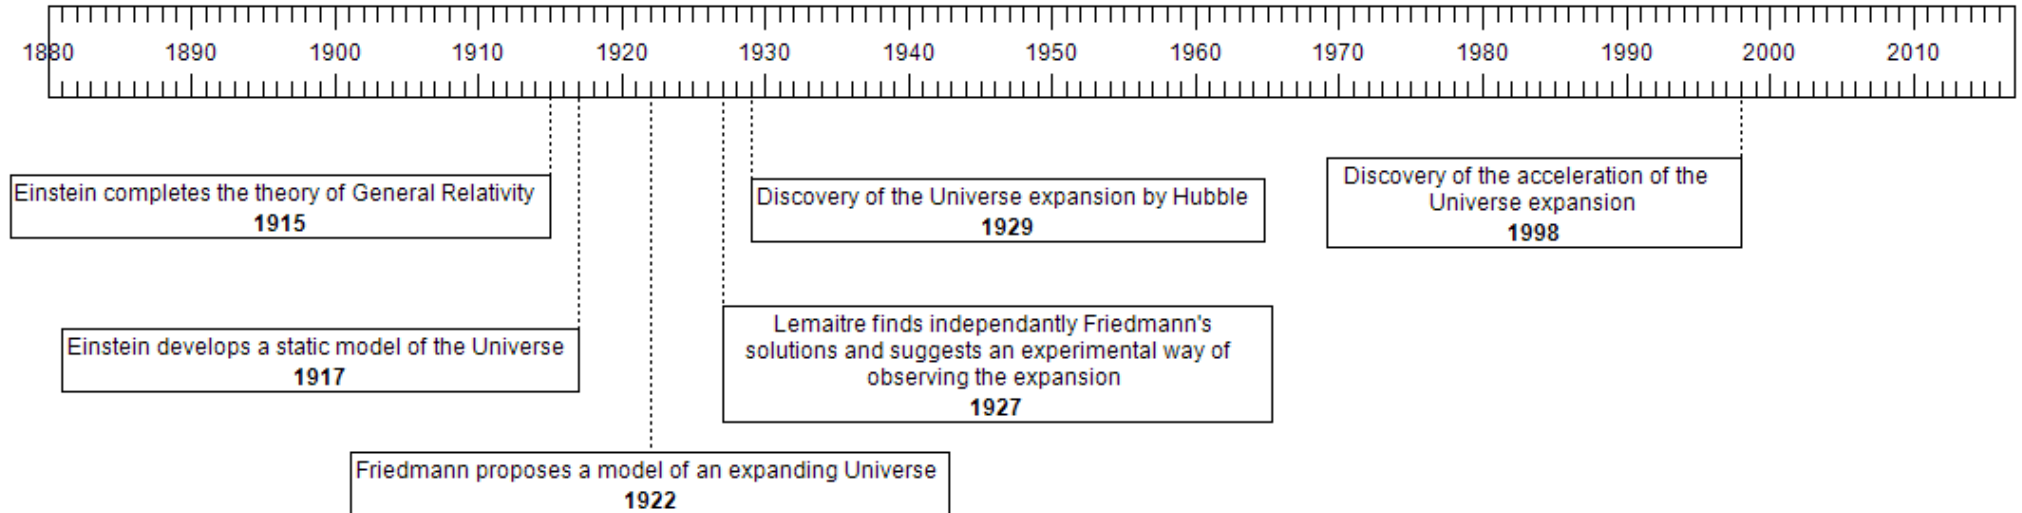

➤ The Universe expansion

$$\text{follows : } \left(\frac{da}{dt} \right)^2 = \frac{\kappa \rho_0}{3a(t)} - K$$
