TOC of the Talk

1 INTRODUCTION

2 AN HISTORICAL PERSPECTIVE

- The first observations of the sky
- Astronomy: celestial mechanics
- Astrophysics: the advent of spectroscopy
- The Universe as we know it today: from the Solar system to the Big Bang

3 METHODOLOGIES FOR THE EXPLORATION OF DISTANT SPACE

- *In situ* exploration
- The current astrophysical vectors of information
- The electromagnetic spectrum & the different astrophysical processes it probes
- The complexity of astrophysical measures

4 AN OVERVIEW OF CONTEMPORARY OPEN QUESTIONS & HOT TOPICS

- How does the Solar system work? How did it form?
- What is the origin of stars & planet, and how do they evolve?
- How do galaxies form, and how does the Universe evolve?
- Do we understand extreme conditions in the Universe?

5 SUMMARY & CONCLUSION

The “Carrington Event”

The “Carrington Event”

1859 Richard CARRINGTON (amateur astronomer) recorded the observation of a large *Coronal Mass Ejection* (CME).

Photometric redshift, based on the shape of the SED → useful but potentially degenerate.

Spectroscopic redshift are more difficult to obtain, but more accurate.

⇒ demonstrates that the laws of physics are identical $\simeq 300$ Myr after the Big Bang.

(D'Eugenio *et al.*, 2023)

Two Enigmatic Cosmological Quantities

Two Enigmatic Cosmological Quantities

Dark Matter: invisible, non-collisional, hypothetical matter (Weakly Interactive Massive Particles; WIMP).

Two Enigmatic Cosmological Quantities

Dark Matter: invisible, non-collisional, hypothetical matter (Weakly Interactive Massive Particles; WIMP).

- First inferred in 1930.

Two Enigmatic Cosmological Quantities

Dark Matter: invisible, non-collisional, hypothetical matter (Weakly Interactive Massive Particles; WIMP).

- First inferred in 1930.
- Responsible for the flattening of the rotation curves of galaxies \rightarrow dark matter halos.

Two Enigmatic Cosmological Quantities

Dark Matter: invisible, non-collisional, hypothetical matter (Weakly Interactive Massive Particles; WIMP).

- First inferred in 1930.
- Responsible for the flattening of the rotation curves of galaxies \rightarrow dark matter halos.
- It is opposed to *baryonic matter* (*i.e.* made of nucleons & electrons).

Two Enigmatic Cosmological Quantities

Dark Matter: invisible, non-collisional, hypothetical matter (Weakly Interactive Massive Particles; WIMP).

- First inferred in 1930.
- Responsible for the flattening of the rotation curves of galaxies \rightarrow dark matter halos.
- It is opposed to *baryonic matter* (*i.e.* made of nucleons & electrons).
- Potentially accounts for $\simeq 85\%$ of the total mass.

Two Enigmatic Cosmological Quantities

GRB: Explosion of a massive star (hypernova) \Rightarrow γ -ray flash + all other wavelengths.

Hot Topics | Gamma-Ray Bursts

GRB: Explosion of a massive star (hypernova) \Rightarrow γ -ray flash + all other wavelengths.

October 9, 2022: The *Gamma-Ray Burst of the Millenium* \rightarrow duration of the γ flash \simeq 600 s.

TOC of the Talk

1 INTRODUCTION

2 AN HISTORICAL PERSPECTIVE

- The first observations of the sky
- Astronomy: celestial mechanics
- Astrophysics: the advent of spectroscopy
- The Universe as we know it today: from the Solar system to the Big Bang

3 METHODOLOGIES FOR THE EXPLORATION OF DISTANT SPACE

- *In situ* exploration
- The current astrophysical vectors of information
- The electromagnetic spectrum & the different astrophysical processes it probes
- The complexity of astrophysical measures

4 AN OVERVIEW OF CONTEMPORARY OPEN QUESTIONS & HOT TOPICS

- How does the Solar system work? How did it form?
- What is the origin of stars & planet, and how do they evolve?
- How do galaxies form, and how does the Universe evolve?
- Do we understand extreme conditions in the Universe?

5 SUMMARY & CONCLUSION

Summary & Conclusion

Summary & Conclusion

Historical Perspective

Summary & Conclusion

Historical Perspective

- Trigonometry → 2D charting, predicting eclipses.

Summary & Conclusion

Historical Perspective

- Trigonometry → 2D charting, predicting eclipses.
- Gravitation → 3D celestial mechanics.

Summary & Conclusion

Historical Perspective

- Trigonometry → 2D charting, predicting eclipses.
- Gravitation → 3D celestial mechanics.
- Quantum physics → spectroscopy (diagnostics, motions).

Summary & Conclusion

Historical Perspective

- Trigonometry → 2D charting, predicting eclipses.
- Gravitation → 3D celestial mechanics.
- Quantum physics → spectroscopy (diagnostics, motions).
- Neutrino, gravitational waves, cosmic rays → new physics.
