Monolithic CMOS Pixels for LHC Trackers

NORBERT WERMES

University of Bonn

Pixel detectors are essential parts of the LHC tracking devices providing track parameter and vertex measurements. The state of the art are so-called hybrid pixel detectors where the pixel sensor element and the readout chip are different entities mated by bonding and flip-chipping technologies. In recent years, depleted monolithic active pixels sensors (DMAPS) have been developed that combine the functionality of both parts. While severe issues of charge collection, cross coupling between sensor, and radiation tolerance impose challenges that had to be addressed, the developments have now reached a level of maturity that they can be considered in the LHC trackers. The talk will give an overview of the developments within ATLAS.

Le café sera servi 10 minutes avant.

NB : La présentation d'une pièce d'identité est exigée à l'entrée du centre. Tous les auditeurs extérieurs sont priés de prévenir à l'avance Martine Oger, tél. 01 69 08 23 50, e-mail : martine.oger@cea.fr. (U.E. : délai de 24 h, hors U.E. : délai de 4 jours).
