# ***Heat transfer through Nb<sub>3</sub>Sn electrical insulation***

Jaroslav Polinski, Bertrand Baudouy

CEA/DAPNIA/SACM

*J. Polinski, B. Baudouy -Heat transfer through Nb<sub>3</sub>Sn electrical insulation*

*2nd KEK-CEA Workshop on Superconducting Magnets and Cryogenics for Accelerator Frontier, CEA Saclay, March 28th 2008*

# Contest

- Motivations of the investigations
- Ceramic (innovative) insulation – stack method
- RAL conventional insulation – drum method
- Technical solution study
- Conclusions

# Contest

- Motivations of the investigations
- Ceramic (innovative) insulation – stack method
- RAL conventional insulation – drum method
- Technical solution study
- Conclusions

# Motivations of the investigations

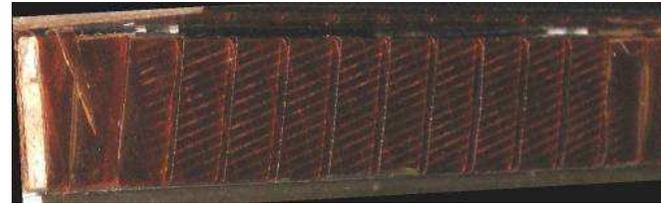

- Operation of the SC accelerators is connected with energy deposition in SC cables due beam losses
  - Current (NbTi) LHC –  $e \approx 0.4 - 0.6 \text{ W/m}$ ,  $10 - 15 \text{ mW/cm}^3$
  - Future (Nb<sub>3</sub>Sn) LHC –  $e \approx 2 - 3 \text{ W/m}$ ,  $50 - 80 \text{ mW/cm}^3$
  - Max temperature margin of the SC cable  $\approx 1.4 \text{ K}$

# Motivations of the investigations

## Kapton insulation sample

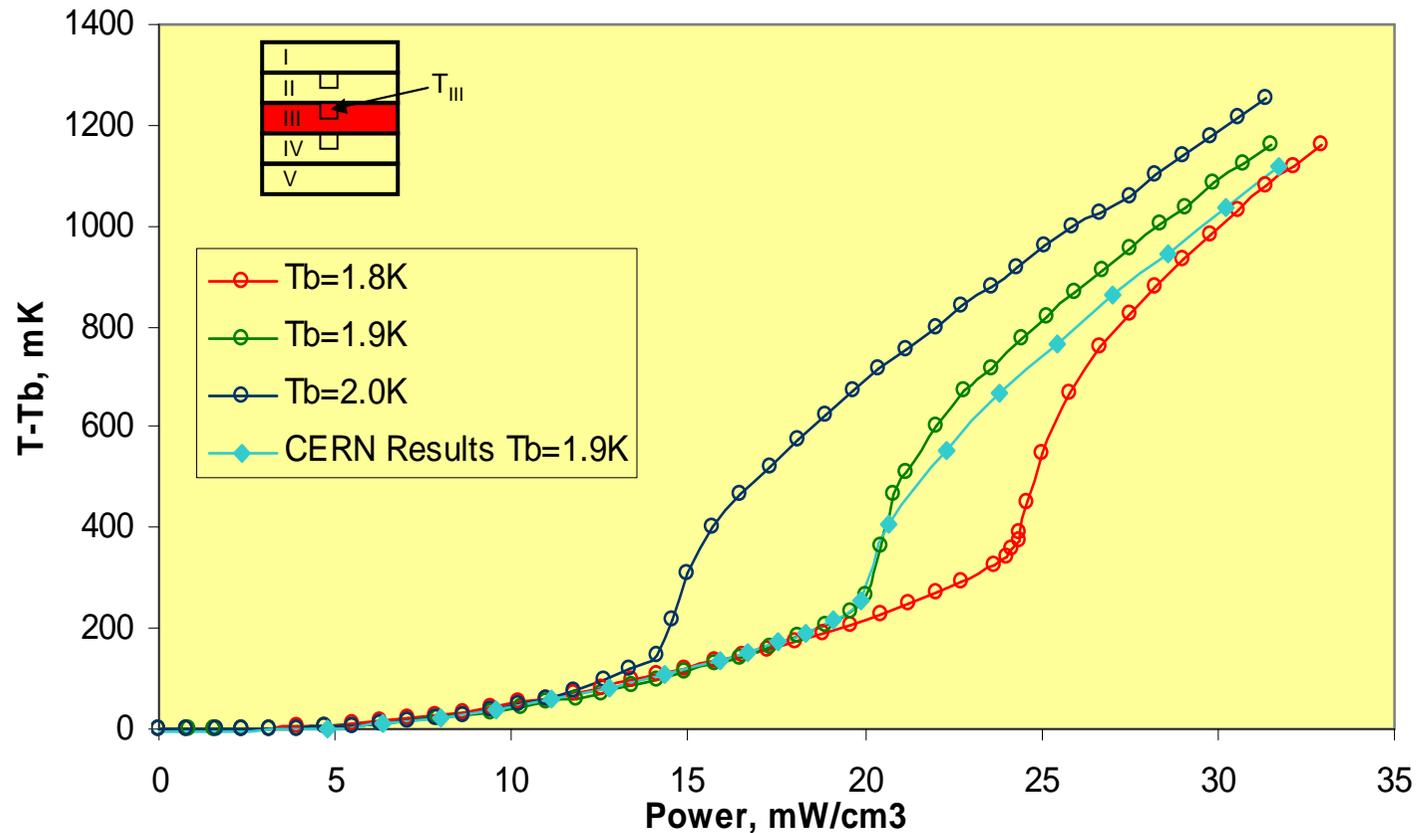

5 dummy stainless steel conductors stack  
17 Tons on the samples as specified  
Central conductor heated

1st layer: Kapton 200 HN (50  $\mu\text{m}$  x 11 mm) in 2 wrappings (no overlap)  
2nd layer: Kapton 270 LCI (71  $\mu\text{m}$  x 11 mm) with a 2 mm gap  
Thermally treatment at 170°C for polymerisation

# Motivations of the investigations

## Kapton insulation results

For  $Q=10 \text{ mW}/\text{cm}^3$  (NbTi) –  $\Delta T \approx 50 \text{ mK}$   
 For  $Q=50 \text{ mW}/\text{cm}^3$  ( $\text{Nb}_3\text{Sn}$ ) –  $\Delta T \approx 2.2\text{K}$  !!!

*J. Polinski, B. Baudouy -Heat transfer through  $\text{Nb}_3\text{Sn}$  electrical insulation*

*2nd KEK-CEA Workshop on Superconducting Magnets and Cryogenics for Accelerator Frontier, CEA Saclay, March 28th 2008*

# Motivations of the investigations

- Operation of the SC accelerators is connected with energy deposition in SC cables due beam losses
  - Current (NbTi) LHC –  $e \approx 0.4 - 0.6 \text{ W/m}$ ,  $10 - 15 \text{ mW/cm}^3$
  - Future (Nb<sub>3</sub>Sn) LHC –  $e \approx 2 - 3 \text{ W/m}$ ,  $50 - 80 \text{ mW/cm}^3$
  - Max temperature of the SC cable  $\approx 1.4 \text{ K}$
- Nb<sub>3</sub>Sn technology need the thermal treatment over 600°C
  - Polyimide (Kapton) insulation operation temperature  $> 400^\circ\text{C}$

NEW GENERATION MAGNETS CALL FOR NEW MATERIALS FOR  
SC CABLES ELECTRICAL INSULATIONS

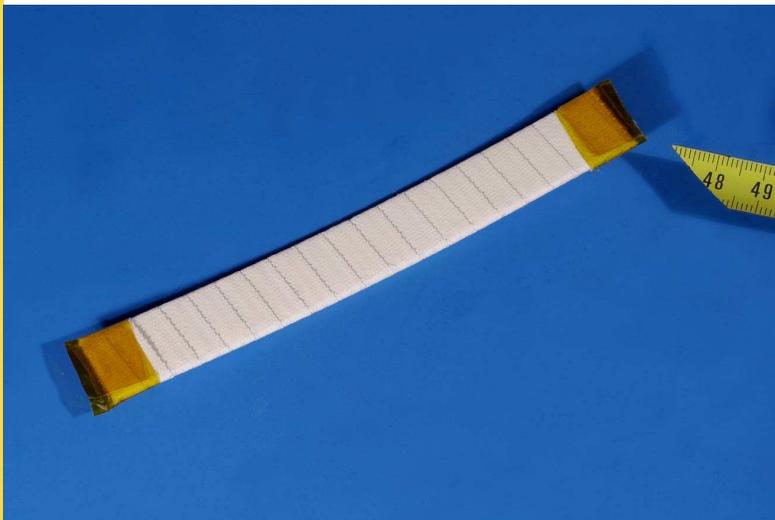

# Contest

- Motivations of the investigations
- Ceramic (innovative) insulation – stack method
- RAL conventional insulation – drum method
- Technical solution study
- Conclusions

# Ceramic (innovative) insulation

## Insulation material

- Mineral fibre tape vacuum impregnated with epoxy resin
- Treated for 50 hours at 666°C at 10 MPa

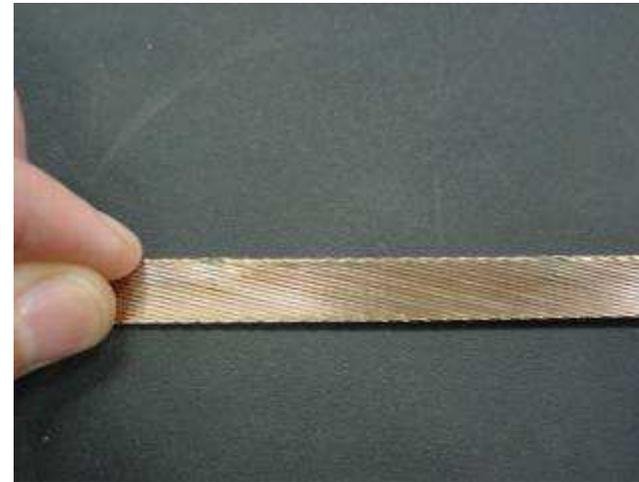

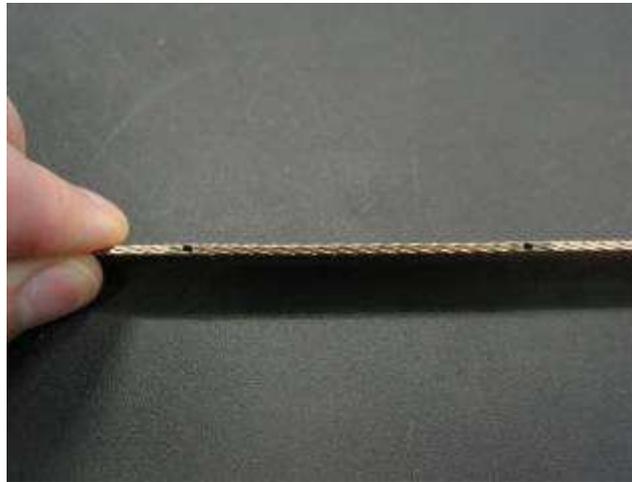

Single cable and sack of cables with ceramic insulation – photo F. Rondeaux

# Ceramic (innovative) insulation

## Dummy conductors (KEK)

- Material: CuNi
- Dimensions: 1.9mm x 11mm x 150mm (T x W x L)
- Conductor fabricated in real cable technology
- CERNOX temp. sensors placed in the quarter of the length and in axis of the conductor

# Ceramic (innovative) insulation

## Test condition

- 10 MPa on the samples as specified
- Temperature of the bath  $T_b = 1.8\text{K}$ ,  $1.9\text{K}$  and  $2.0\text{K}$
- All conductors heated
- Supplied current range: 0 – 10 Amps
- Dissipated heat range: 0 –  $\approx 42 \text{ mW/cm}^3$
- Temperature measured on the central conductor

# RAL insulation

## Drum setup

- Theoretical Background of the Method (1/2)

$$\frac{Q_s}{A} = \begin{cases} h_k (T_i^n - T_1^n) \\ \frac{\lambda}{l} (T_1 - T_2) \\ h_k (T_2^n - T_b^n) \end{cases} = \frac{1}{R_s} (T_i - T_b) = \frac{1}{R_s} T \Delta$$

- $A$  – Active area of the heat transfer
- $h_k$  – Kapitza heat transfer coefficient
- $\lambda$  – Thermal conductivity of the material
- $l$  – material thickness
- $R_s$  – overall thermal resistance of the sample
- $T_i$  – temperature of the heated volume
- $T_1$  – temperature of the sample surfaces from the heated volume side
- $T_2$  – temperature of the sample surfaces from the constant T bath
- $T_b$  – temperature of the constant T bath

*J. Polinski, B. Baudouy -Heat transfer through Nb<sub>3</sub>Sn electrical insulation*

# RAL insulation

## Drum setup

### – Theoretical Background of the Method (2/2)

Since  $\Delta T \gg T_b$  it can be assumed that:

$$h_K (T_i^n - T_1^n) \approx n \cdot h_K \cdot T_i^{n-1} (T_i - T_1)$$

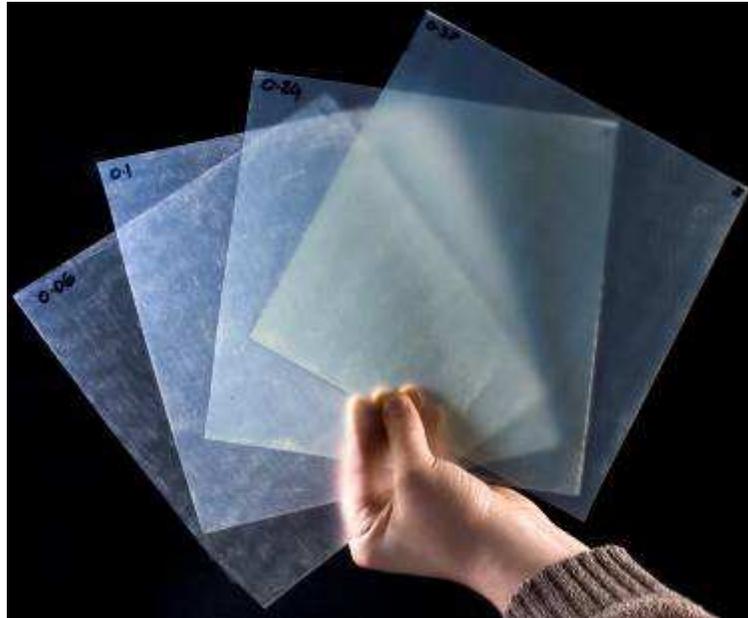

$$h_K (T_2^n - T_b^n) \approx n \cdot h_K \cdot T_b^{n-1} (T_2 - T_b)$$

And finally overall thermal resistance of the sample:

$$R_s = \frac{A \Delta T}{Q_s} = \frac{1}{n \cdot h_K \cdot T_i^{n-1}} + \frac{l}{\lambda} + \frac{1}{n \cdot h_K \cdot T_b^{n-1}} \approx \frac{2}{n \cdot h_K \cdot T_b^{n-1}} + \frac{l}{\lambda} \approx \frac{2}{R_K} + \frac{l}{\lambda}$$

## Study of sheets surface area and thickness

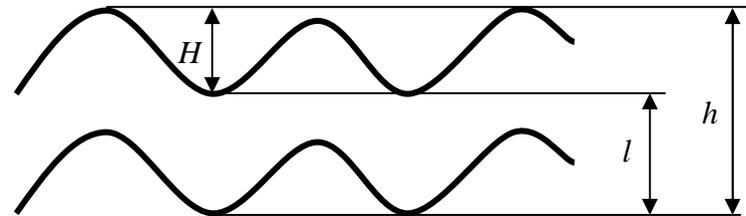

Sheet surface photo

3D profilometer results example

Surface mathematical description

Thickness determination

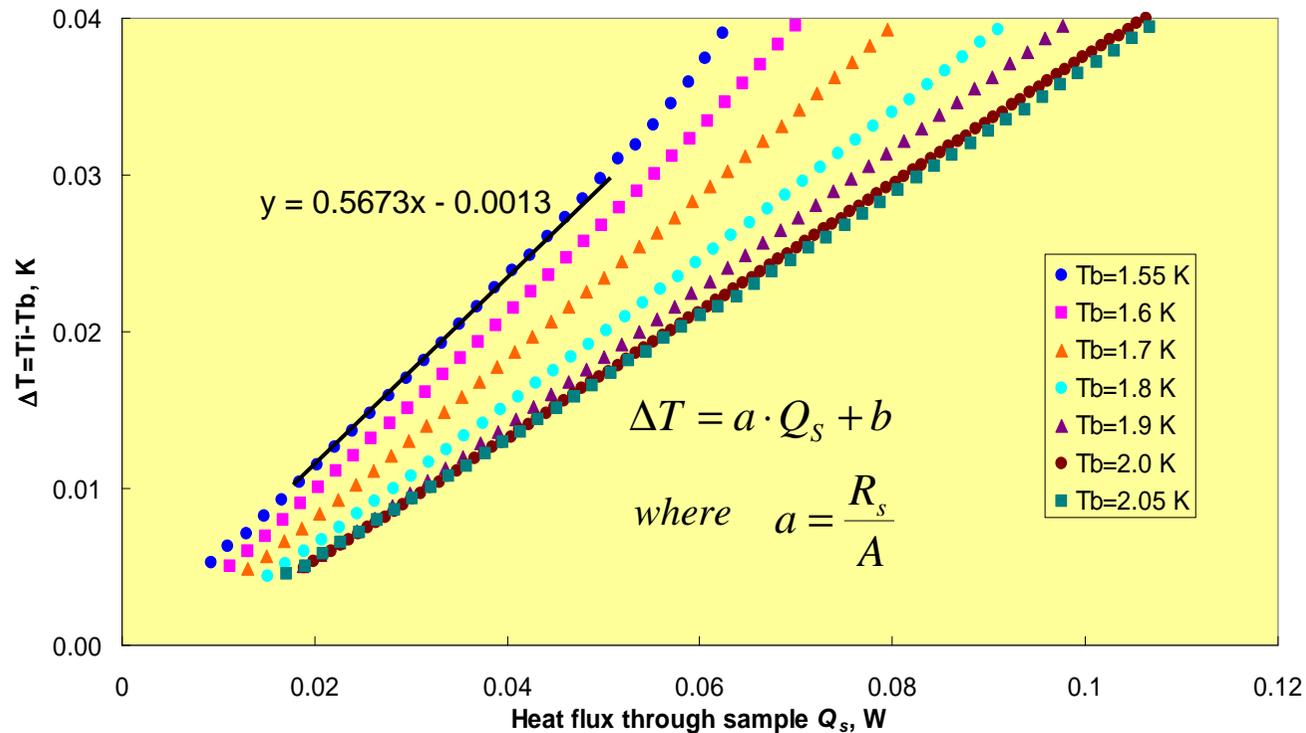

# RAL insulation

## Tests conditions

- 4 sheets with different thicknesses
- 7 different temperatures of the bath from range: 1.55 K – 2.05 K
- Temperature of the inner volume:  $T_b - T_\lambda$
- Heat dissipated in inner volume: 0 – 0.8 W
- Range of  $\Delta T$  accounted in computation process: 10 – 30 mK

# RAL insulation

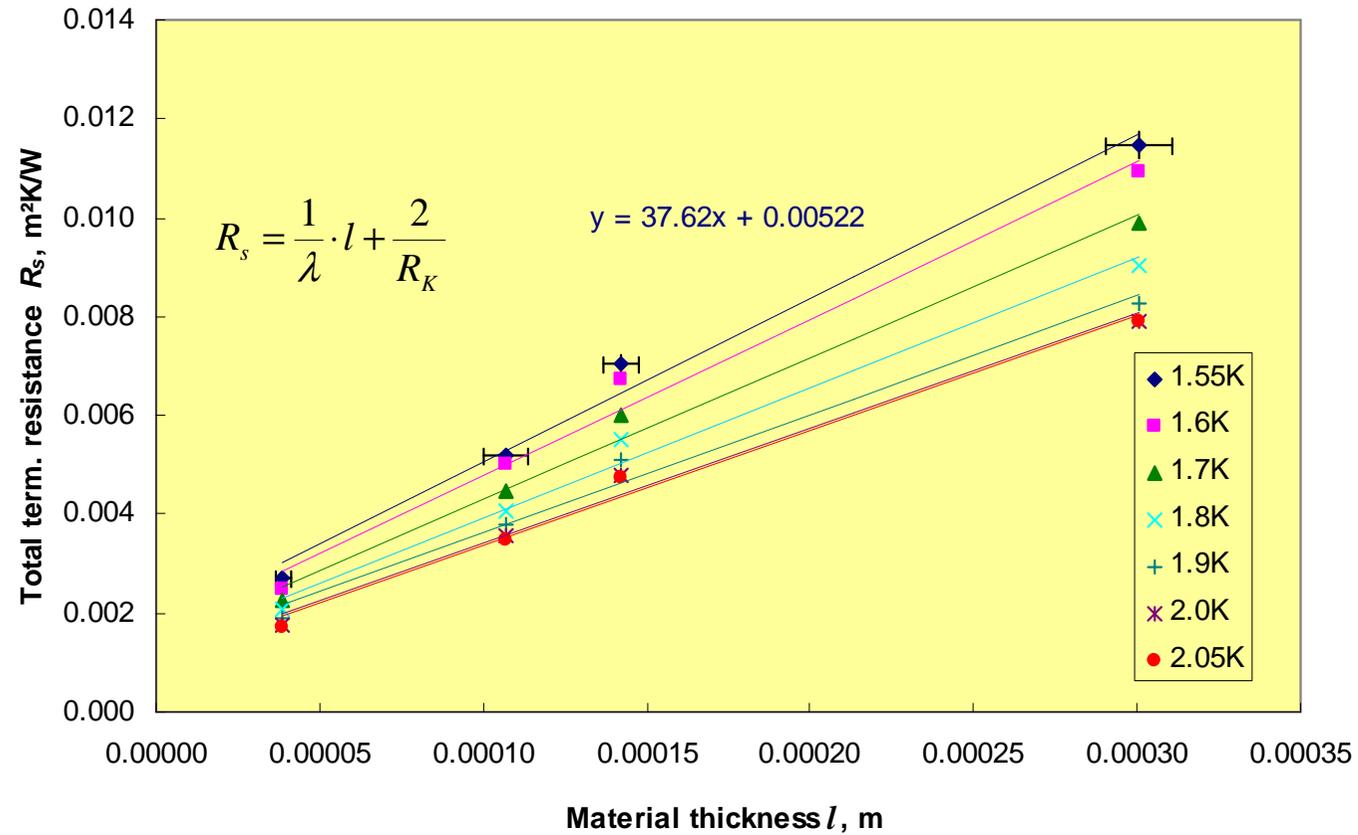

Test results and computation process, example for  
 $l=0.039$  mm

Evolution of the temperature difference across the sample with heat flux as a function of the bath temperature.

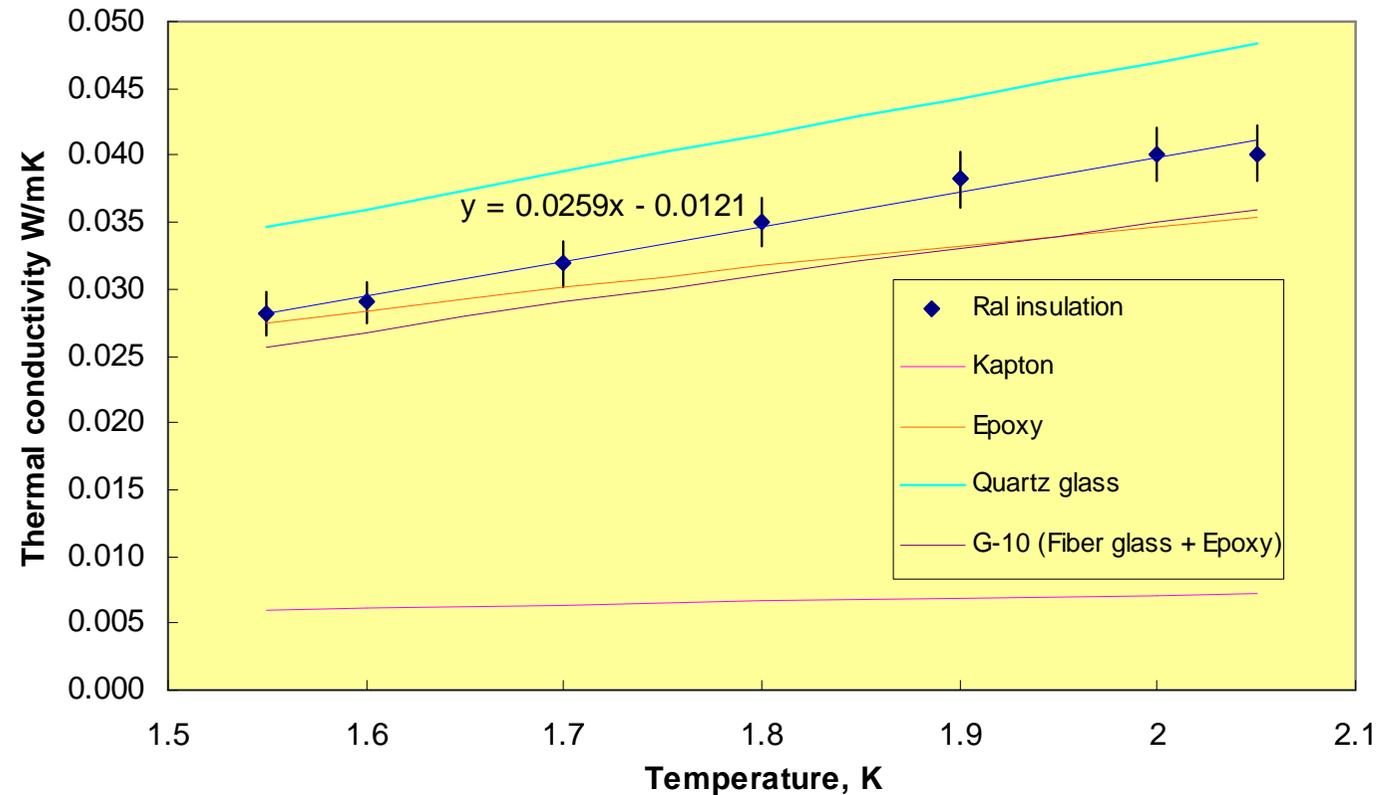

# RAL insulation

## Computation process

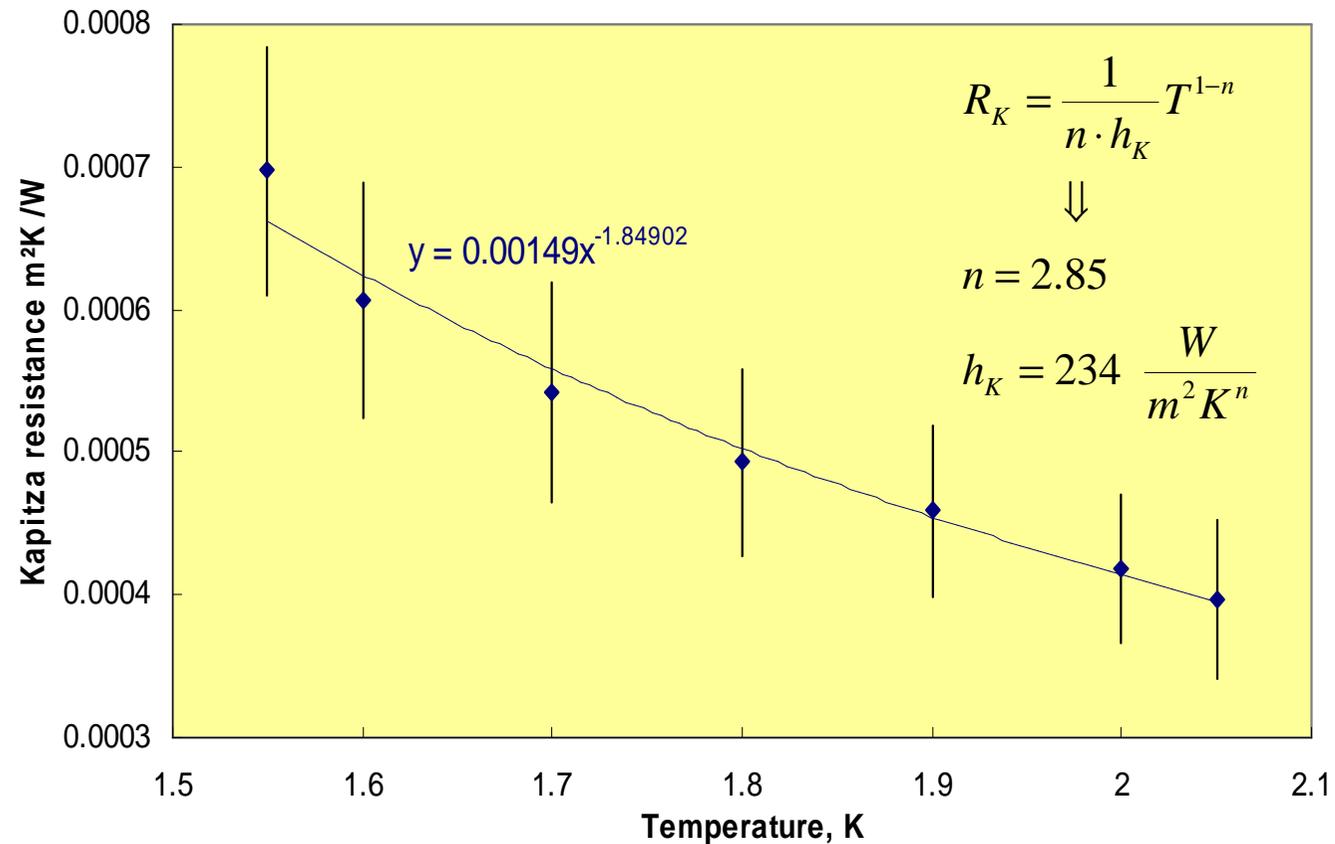

# RAL insulation

## Thermal conductivity, comparison with other materials

# RAL insulation

## Kapitza Resistance

For Kapton insulation:

@2.05K  $R_K = 0.00134 \text{ m}^2\text{K/W}$

@1.55K  $R_K = 0.00277 \text{ m}^2\text{K/W}$

# Contest

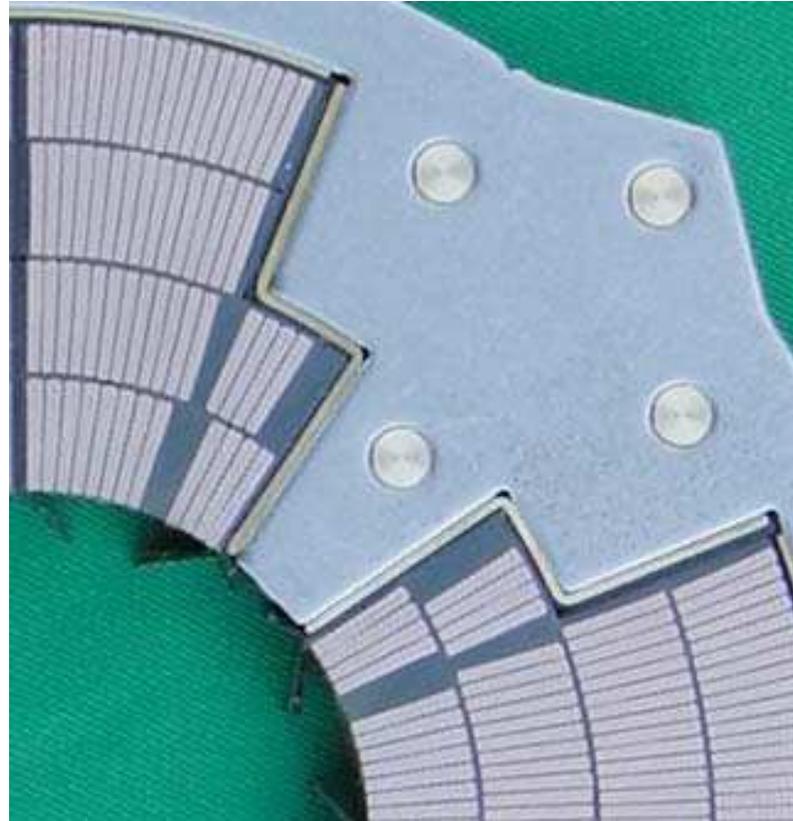

- Motivations of the investigations
- Ceramic (innovative) insulation – stack method
- RAL conventional insulation – drum method
- Technical solution study
- **Conclusions**

# Conclusion

- For Nb<sub>3</sub>Sn technology magnets beam losses heat generation in cables would be about 5 times higher than for NbTi technology
- Temperature margin as 2.2 K is expected when the LHC convectional electrical insulation is used to Nb<sub>3</sub>Sn cables
- Innovative ceramic insulation seems to be very good solution for future Nb<sub>3</sub>Sn magnets
- Thermal conductivity of the RAL insulation material is 5 times lower and Kapitza resistance is 4 times lower than for Kapton – RAL material can be considered as new conventional insulation
- Yoke of magnet can strongly restrict heat transport from cables. Application of the G10 interlayer spacers improve heat transfer process.
