### Outline

Introduction Large-radius jets Jet tagging Searches Outlook and Summary

#### Outline

What's wrong with the Standard Model? What's wrong with the SM? Why Boosted Objects?

- Why do we need boosted object identification?
- Calibrating large-R jets
- Tagging jets containing heavy objects
- Outlook

Will focus on the details of ATLAS studies - CMS also has an active and productive boosted object search programme

Searches for  $t\overline{t}$  resonances

2/77

## The Standard Model

Introduction Large-radius jets Jet tagging Searches Outlook and Summary

Outline What's wrong with the Standard Model? What's wrong with the SM? Why Boosted Objects?

#### The Standard Model (SM) of particle physics:

- Fermionic matter:
  - Three generations of quarks
  - Three generations of leptons
- Gauge Bosons:
  - Four Force carriers : γ(EM), W<sup>±</sup>, Z (Weak), g (strong)
  - The Higgs Boson to give mass

"Was she pretty?" asked the bigger of the small girls. "Not as pretty as any of you," said the bachelor, "but she was horribly good." **The storyteller - H. H. Munro (Saki)** 

- 4 回 2 - 4 回 2 - 4 回 2 - 5 - 5 - 5

## SM Problems

Introduction Large-radius jets Jet tagging Searches Outlook and Summary

Outline What's wrong with the Standard Model? What's wrong with the SM? Why Boosted Objects?

So what's wrong with the Standard Model?

- No Dark Matter candidates
- Not enough CP violation to explain the observed matter-antimatter imbalance
- The Higgs boson has still not been observed
- No gravity
- Particle masses are not understood

Is there physics beyond the Standard Model?

< E ► < E ► E

## The LHC

Introduction Large-radius jets Jet tagging Searches Outlook and Summary

Outline What's wrong with the Standard Model? What's wrong with the SM? Why Boosted Objects?

Where to look for answers? The Large Hadron Collider at CERN

- 27 km circumference ring
- Currently collides protons at centre-of-mass energy 8 TeV
- Four detectors installed around the ring
- An excellent environment to test the Standard Model and search for new Physics
- Triviality/Unitarity constraints on some SM cross sections imply a Higgs Boson or <u>something else</u> at an energy scale < 800 GeV</li>

- 4 回 2 - 4 □ 2 - 4 □

Introduction Large-radius jets Jet tagging Searches Outlook and Summary

Outline What's wrong with the Standard Model? What's wrong with the SM? Why Boosted Objects?

What equipment to use? A Toroidal Large ApparatuS (ATLAS)

**ATLAS** with full solid angle coverage, excellent charged particle tracking, particle ID and energy measurement is well-suited for TeV-Scale physics (and so is CMS of course)

イロン イ団 とくほ とくほとう

## New Physics

Outline What's wrong with the Standard Model? What's wrong with the SM? Why Boosted Objects?

Many candidates for new physics, some leading candidates:

- Fermion/boson symmetry: New scalar tops, other new heavy particles
- Extra dimensions (ED): New TeV scale bosons and fermions, Heavy quarks that like to decay to 3rd generation quark + EW bosons
- **Compositeness/ Warped ED**: New heavy particles that prefer to couple to heavy SM particles e.g. resonance to  $t\bar{t}, WW, ZZ, WZ, HH, ZH$
- Exotics Higgs: New charged and neutral scalars that prefer to decay to heavy SM particles

Exclusion limits are pushing towards very high-mass scales

Introduction Large-radius jets Jet tagging Searches Outlook and Summary

Outline What's wrong with the Standard Model? What's wrong with the SM? Why Boosted Objects?

When pushing to higher energies, new factors come into play e.g. for top quarks:

#### Low-energy tops

 $t \rightarrow bW, W \rightarrow qq'$  gives three distinct "jets":

#### High-energy tops

top decay system is highly boosted and reconstructed as only one jet:

Top Monojet

Need new techniques to identify these boosted=objects = James Ferrando Searches for ti resonances 9/77

## Parton Merging

Outline What's wrong with the Standard Model? What's wrong with the SM? Why Boosted Objects?

Merging of some description occurs for SM  $t\bar{t}$  production:

Effect must be taken into account for SM measurements at higher  $P_T^t$  or  $M_{t\bar{t}}$  (ATL-PHYS-PUB-2010-008) **Question:** How can we handle this merging ?

#### Jet substructure

Outline What's wrong with the Standard Model? What's wrong with the SM? Why Boosted Objects?

#### Answer: Probe the substructure of the jets!

- Select a large radius jet to ensure you capture all particles of interest
- Resolve the image at a smaller scale to identify interesting substructure
- Or use well chosen variables that highlight characteristic features of EW decays vs QCD jet formation

11/77

#### Large-radius jets

Introduction Large-radius jets Jet tagging Searches Outlook and Summary

Building Large-radius jets Jet substructure variables Calibration of large-radius jets

### Large-radius jets and substructure

三日 ・ヨト・ヨト・ (四ト)

Introduction Large-radius jets Jet tagging Searches Outlook and Summary

Building Large-radius jets Jet substructure variables Calibration of large-radius jets

Jets formed by the successive recombinations of pairs of particles:

#### Distance parameter

$$d_{ij} = \min(k_{T,i}^{2p}, k_{T,j}^{2p}) \frac{(\Delta \phi_{i,j}^2 + \Delta y_{i,j}^2)}{R^2}$$

- $p = 1 k_T$  algorithm
- *p* = 0 Aachen/Cambridge algorithm
- p = -1 Anti- $k_T$  algorithm
- Find pair with smallest *d<sub>ij</sub>*
- if  $d_{iB} = k_{T,i}^2 < d_{ij}$  then *i* is a *jet* and is no longer considered
- Else, replace pair with one *pseudojet* with four-momentum  $k_i + k_j$

All of these algorithms are infra-red and collinear safe. Jets in event depend on R and algorithm choice.

13/ 77

## Clustering History

Clustering History conveys information about the jet,  $d_{ij}$  tends to increase  $\sim$ monotonically throughout the procedure:

- k<sub>t</sub> merges softest particles first at last stage of merging pseudojets have high-p<sub>T</sub> and large spatial separation
- C/A merges spatially-closest pairs of particles first at last stage of merging pseudojets are widest angle pair
- Anti- $k_t$  finds hardest particle and clusters the spatially closets particles with  $\Delta R < R$  at last stage of merging particle with largest spatial distance to centre of jet is combined with central core

### Jet Differences

15/77

## Choosing your jets

Building Large-radius jets Jet substructure variables Calibration of large-radius jets

So how to choose the jet algorithm for boosted objects?

- Parameter R usually driven by considering that  $\Delta R < \sim \frac{2m}{p_T}$  for a two body decay
  - Typically values 0.8 < *R* < 1.5 used for boosted objects (0.4 ≥ *R* ≤ 0.6 used for "standard" jets)
- Calibration considerations:
  - Regular shape of anti-k<sub>t</sub> jets makes calibration and correction for pile-up easier
- Substructure considerations:
  - k<sub>t</sub> and C/A cluster history contains more physical information about the jet

프 🖌 🛪 프 🕨

### Jet Substructure

What kind of substructure variables can we use?

- The jet mass
- Values related to d<sub>ij</sub> in the cluster history
- Jet shape variables such as *N-subjettiness* constructed from all constuents of the jet

Combinations also possible, e.g. minimum pairwise mass of hardest three subjets, etc.

- 4 回 ト - 4 回 ト - 4 回 ト

Introduction Large-radius jets Jet tagging Searches Outlook and Summary

Building Large-radius jets Jet substructure variables Calibration of large-radius jets

#### The simplest choice, jet invariant mass:

Jet Mass

 ${\it W}$  and top peaks clearly visible, QCD shape selection dependent

Jet Mass

Introduction Large-radius jets Jet tagging Searches Outlook and Summary

Building Large-radius jets Jet substructure variables Calibration of large-radius jets

How does it look compared to data?

Example of a variable that uses the cluster history is  $d_{12}$ :

- Recluster the original jet with the  $k_t$  algorithm
- Force the relustering to stop when there are two pseudojets left
- Calculate  $d_{12} = \min(p_{T,1}, p_{T,2})\Delta R_{12}$
- Gives a "splitting scale" variable once raised to power 1/2
- Analagous variables:  $d_{23}$  for three pseduojets and so on
- Less scale dependent variables can be constructed by dividing by jet Energy, jet  $p_T$ , jet mass or  $\sqrt{m^2 + d_{ij}}$  (also sometimes known as  $z_{12}$ )

イロン イヨン イヨン キヨン 正

d<sub>ij</sub>

Introduction Large-radius jets Jet tagging Searches Outlook and Summary

Building Large-radius jets Jet substructure variables Calibration of large-radius jets

James Ferrando Searches for  $t\bar{t}$  resonances 21/77

★ 문 ▶ 문 문 권

*N*-subjettines variables ,  $\tau_N$  quantify how well jets can be described as containing *N* or fewer  $k_t$  subjets.

Recluster a jet up to *N*-subjets with the  $k_t$  algorithm then calculate  $\tau_N$ :

$$au_{N} = rac{1}{d_{0}}\sum_{k} p_{T,k} imes \min(\Delta R_{1,k}, \Delta R_{2,k}, ..., \Delta R_{3,k})$$

where  $\Delta R_{i,k}$  here is the distance in the jet measure  $(d_{mn})$ , from subjet *i* to constituent *k*.

Ratios  $\tau_i / \tau_j$  are referred to as  $\tau_{ij}$ 

Other jet-shape type variables also exist and many have been tested

イロト イヨト イヨト イヨト

### **N-Subjettiness**

Introduction Large-radius jets Jet tagging Searches Outlook and Summary

Building Large-radius jets Jet substructure variables Calibration of large-radius jets

James Ferrando Searches for  $t\bar{t}$  resonances 23/77

# Energy/momentum calibration

M Introduction Large-radius jets Jet tagging Searches Outlook and Summary

Building Large-radius jets Jet substructure variables Calibration of large-radius jets

The large-R jets are calibrated using a Monte-Carlo based method:

- Locally calibrated clusters of energy from the calorimeter are fed to the jet algorithms (corrections applied based on response from single-pion MC)
- Jet response to *p*<sub>T</sub> and **m** is corrected using relationship between true and reconstructed jet values in MC

(ATLAS Coll., JHEP09 (2013) 076)

## Validation

Building Large-radius jets Jet substructure variables Calibration of large-radius jets

The calibration is mainly validated using track-jets:

 Use ratio calorimeter to track based quantities:

$$r_{
m track\ jet}^{m} = rac{m^{
m jet}}{m^{
m track\ jet}}$$
  
In particular, the double ratio is used to quantify uncertainties:  
 $R_{r
m track\ jet}^{m} = rac{r_{
m track\ jet}^{m,
m MC}}{r_{
m track\ jet}^{m,
m MC}}$ 

## Grooming

Introduction Large-radius jets Jet tagging Searches Outlook and Summary

Building Large-radius jets Jet substructure variables Calibration of large-radius jets

Additional challenge for large-radius jets:

- Mass (and other substructure) is sensitive to pile-up
- Need a way to mitigate this effect

Common techniques: Trimming, Pruning, mass-drop filtering

26/77

Typical example parameters for ATLAS:

- Intial jet: R = 1.0 Anti- $k_t$
- $f_{\rm cut} = 0.05$
- $\blacksquare R_{\rm sub} = 0.3$

ATLAS /+jets Introduction Large-radius jets Jet tagging Searches Outlook and Summary

The first search to fully combine boosted and resolved approaches: Phys. Rev. D 88, 012004 (2013)

- Boosted:
  - lepton
  - $\blacksquare E_T^{\text{miss}}$
  - $\geq 1$  large-R jet with  $p_T > 350\,$  GeV and large jet-mass and  $d_{12}$
  - ≥ 1 *b*-jet
- Resolved
  - Fails boosted selection
  - lepton
  - $E_T^{\text{miss}}$
  - $\blacksquare \geq 4$  jets or  $\geq 3$  jets and one jet has a mass  $> 60 \, \text{GeV}$
  - $\geq 1$  *b*-jet

included also several improvements compared to previous iterations

◆□ > ◆□ > ◆三 > ◆三 > 三日 のへで

## We can make it better

Introduction Large-radius jets Jet tagging Searches Outlook and Summary

 $t\bar{t}$  resonances: I+jets ATLAS searches with the Full 7 TeV data  $t\bar{t}$  resonances: fully hadronic Mono-W

Building a better search:

- **Resolved:** Improve *tt* reconstruction
- Boosted: Add *b*-tagging (reduce large W+jets background),
- Both: Improve isolation definition,

< E > < E > E

# Lepton Isolation

 $t\bar{t}$  resonances: I+jets ATLAS searches with the Full 7 TeV data  $t\bar{t}$  resonances: fully hadronic Mono-W

Conventional lepton isolation is also a problem for boosted tops: Standard isolation requirements: **b-jet** 

- Require lepton and nearest jet well separated (  $\Delta R(l,j) > 0.4$  )
- require p<sub>T</sub> within a small cone around the lepton track is less than some value

46/77

Solution: Adopt mini-isolation (JHEP 1103 (2011) 059)

- Size of isolation cone shrinks with  $p_T$ ,  $\Delta R = k/p_T^l$  (in the case of ATLAS k = 10 GeV is used)
- Require  $p_T$  with that cone is less than some value (in the case of ATLAS  $< p_T^l/20.0$  )

... and relax requirement on  $\Delta R(l,j)$  in the  $\mu$  channel.

## Lepton Isolation

Introduction Large-radius jets Jet tagging Searches Outlook and Summary

 $t\bar{t}$  resonances: I+jets ATLAS searches with the Full 7 TeV data  $t\bar{t}$  resonances: fully hadronic Mono-W

Performance of mini-isolation is very good and stable for different Z' masses (1.0 TeV (left) and 2 TeV (right))

< ≣ >

## Selection Efficiency

Introduction Large-radius jets Jet tagging Searches

Outlook and Summarv

 $t\bar{t}$  resonances: I+jets ATLAS searches with the Full 7 TeV data  $t\bar{t}$  resonances: fully hadronic Mono-W

- Muon channel efficiency now rises with  $m_{t\bar{t}}$

48/77

## Selection efficiency

Introduction Large-radius jets Jet tagging Searches

Outlook and Summary

 $t\bar{t}$  resonances: I+jets ATLAS searches with the Full 7 TeV data  $t\bar{t}$  resonances: fully hadronic Mono-W

Overall signal efficiency is high (this value is relative to all  $t\bar{t}$ )

# Going to 8 TeV

Introduction Large-radius jets Jet tagging Searches Outlook and Summary

 $t\bar{t}$  resonances: I+jets ATLAS searches with the Full 7 TeV data  $t\bar{t}$  resonances: fully hadronic Mono-W

First ATLAS search using partial 8 TeV dataset:

#### Improvements:

■ Introduced Trimming of large-*R* jet to mitigate pile-up

#### Disadvantages:

 large-R jet triggers not available at this time (large hit in muon channel efficiency)

# Selection Efficiency

## Outlook and Summary

Introduction Large-radius jets Jet tagging Searches Outlook and Summary

- ATLAS has commissioned many tools for identifying hadronically decaying boosted objects
- Performance of boson and top tagging now being systematically studied - expect publications on this topic in the not-so-distant future
- First uses in searches have been very successful
- Candidates for use will grow substantially in Run-II, expect more searches with boosted W/Z/H/t
- The machinery is now also well-enough tested for use in measurements

More on /+jetsFuture of  $t\bar{t}$  resonances

## Back-up

Many new physics scenarios predict heavy particles that decay to  $t\bar{t}$ :

- Extra dimensions (Bulk RS): Excitations of gluon (g<sub>KK</sub>)/ graviton (G<sub>KK</sub>) preferentially decay to tt
- **Topcolor-assisted Technicolor**: Strong EWSB model via a top condensate expect top- $\pi$  (*H*-like) and top- $\rho$  (*Z'*-like) the latter heavy enough to decay to  $t\bar{t}$
- Composite Higgs scenarios: Usually require (naturalness) extra heavy-fermions, and commonly heavy "gluons" that decay to t<sub>R</sub> or new heavy fermions depending on the masses
- **BSM Higgs**: New heavy pseudoscalar Higgs-like particles in, e.g. the MSSM, would also have a large *t*t branching ratio

## $t\bar{t}$ resonances II

Searches so far have focused on two benchmark scenarios:

- Topcolor-assisted technicolor (TC2)  $Z'_{
  m TC2} 
  ightarrow t ar{t}$ 
  - Spin-1
  - Color singlet
  - Narrow width (1.2%) modelled with SSM Z' (3%) width
  - hep-ph/9911288,
     Eur. Phys. J. C (2012) 72 2072
- RS Kaluza-Klein Gluon  $g_{\mathrm{KK}} 
  ightarrow t ar{t}$ 
  - Spin-1
  - color octet
  - wide (10-15%)
  - $\mathcal{BR}(g_{\mathrm{KK}} 
    ightarrow t \overline{t}) \sim 92.5\%$
  - JHEP 0709 (2007) 074

More on /+jetsFuture of  $t\overline{t}$  resonances Towards Run II Upgrade Schedule

What's next?

- Towards LHC run-II
- Prospects with the upgraded LHC

< 🗇 🕨

< E

## Towards Run II

More on /+jetsFuture of  $t\bar{t}$  resonances Towards Run II Upgrade Schedule

How much luminosity is neeed at 13 TeV to be competitive with current data?

(simple extrapolation using cross sections for Z' and NLO  $t\bar{t}$  in appropriate  $m_{t\bar{t}}$  range)

## Towards Run II

More on /+jetsFuture of  $t\bar{t}$  resonances Towards Run II Upgrade Schedule

Reach should start to increase as we approach 6-7  ${
m fb}^{-1}$ 

ъ

## Upgrades

More on /+jetsFuture of  $t\bar{t}$  resonances Towards Run II Upgrade Schedule

#### Upgrade Schedule More on /+jets Future of tr resonances

Towards Run II Upgrade Schedule

## Example, ATLAS upgrade schedule:

#### Phase I

- Installation Date: 2018-19
- Detector upgrades:

 $\mu$ -trigger, L1 Calo-trigger, FTK, new Small wheel for muons, new forward detectors. Various readout improvements. (Maintain performance at higher luminosity)

• Lumi  $2.2 \times 10^{34} \,\mathrm{cm}^{-2} \mathrm{s}^{-1}$ , 300-400 fb<sup>-1</sup> by 2022,  $\mu = 55\text{-}80$ 

#### Phase II

- Installation Date: 2022-24
- Detector upgrades: Split L0/L1 trigger, numerous trigger and readout upgrades, improved HLT, RPC precision upgrade, complete tracker replacement. ( Maintain/improve performance at higher μ, improve resistance to radiation damage)
- **Lumi**  $5 \times 10^{34} \, \mathrm{cm}^{-2} \mathrm{s}^{-1}$ , up to 3000 fb<sup>-1</sup>,  $\mu =$  140-200

72/77

Towards Run II Upgrade Schedule

ATLAS upgrade performance and physics prospects have been studied in:

- Phase-I LOI: CERN-LHCC-2011-012
- Phase-II LOI: CERN-LHCC-2012-022
- *tī* resonance search: ATL-PHYS-PUB-2013-003

Studies of  $t\bar{t}$  resonance searches done with a parametrisation of detector response, not at the full-simulation level.

More on /+jetsFuture of  $t\bar{t}$  resonances Towards Run II Upgrade Schedule

•  $t\bar{t}$  in simplified *I*+jets (boosted) and dilepton selections
