## Future plans and improvements

- Improve analysis and include tracking information
- Improve photocathode quality
- Further improve detector, mesh and accuracy
- Optimize gas mixture
- Radiation hardness
- High rate protection

# Towards ultra-low capacitance MM

- Spark protection
- Preserves fast electron signal

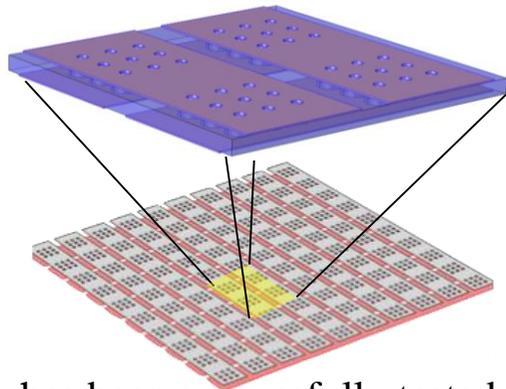

Anode strip element

First prototype was fabricated using microbulk kapton etching

**Results are encouraging:** high gain, good energy resolution, **Capacitance x3 lower**

## Future improvements

Combine with anode mesh segmentation to reduce capacitance

- Pad read-out
- Move pad read-out back by 1-2 mm
- To further reduce capacitance

### Ultimate goal

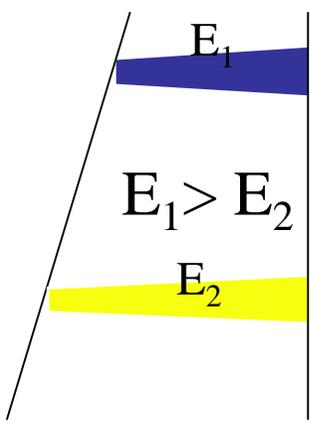

Read-out pad or strip capacitance  $< 1$  pF

→ Charge released by spark  $< 10^9$  electrons

The idea has been successfully tested

*Th. Geralis et al., PoS TIPP2014 (2014) 055*

**To reach the goal we need new high-precision fabrication technology**

# High gas pressure detector deal

$$dG/G = apd(1 - Bpd/V) = apd(1 - Bp/E)$$

The gain variation exhibits a minimum for :

$$d = V/Bp$$

Ideal gap

## Message

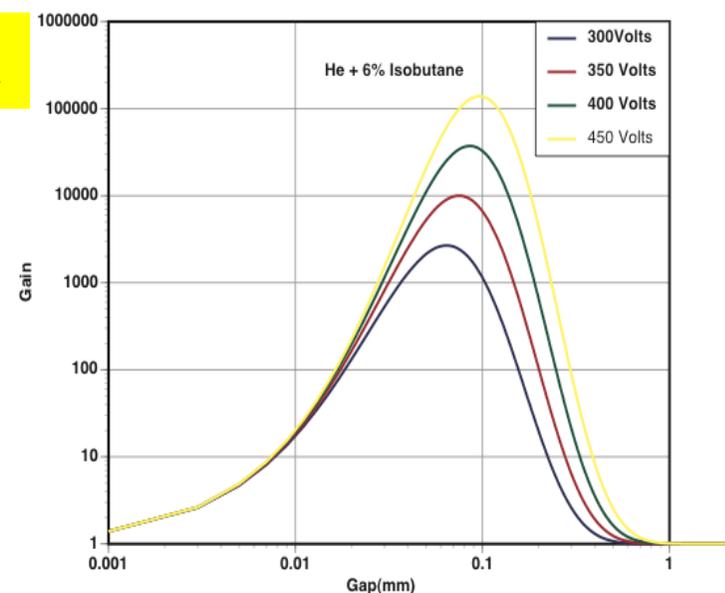

For high pressure operation up to 10 bar  
We need a small 10-30  $\mu\text{m}$  gap

The idea of small gap MM was tested *D. Attie et al., JINST 9 (2014) C04013*

Gaps of 12.5, 25, 50  $\mu\text{m}$  have been fabricated and successfully tested

From this study we concluded that the highest achievable gain was lower with smaller gaps  
To improve gain we need to fabricate much smaller mesh holes, smaller than gap length  
of the order of 5- 10  $\mu\text{m}$

To reach the goal we need new high-precision fabrication technology

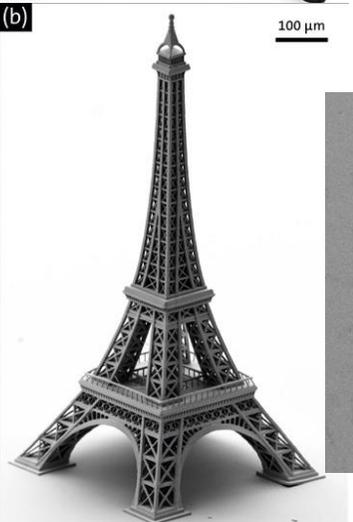

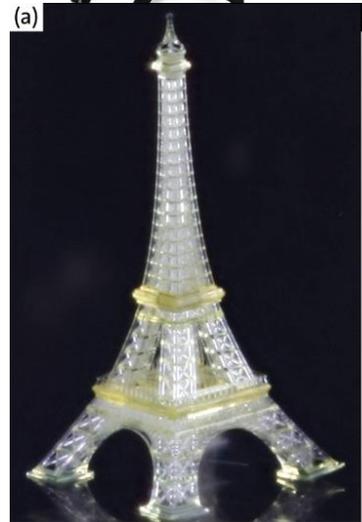

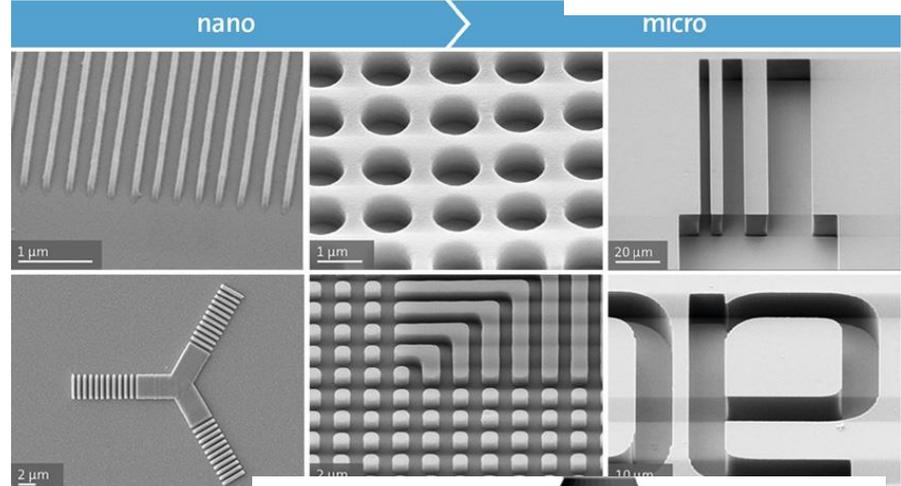

Ref: Y. Giomataris, NIM A419, p239 (1998)  
Optimum gap : 30 - 100 microns

and neutrino physics**

# Radial TPC with spherical proportional counter read-out

Saclay-Thessaloniki-Saragoza

A Novel large-volume Spherical Detector with Proportional Amplification read-out, I. Giomataris *et al.*, JINST 3:P09007,2008

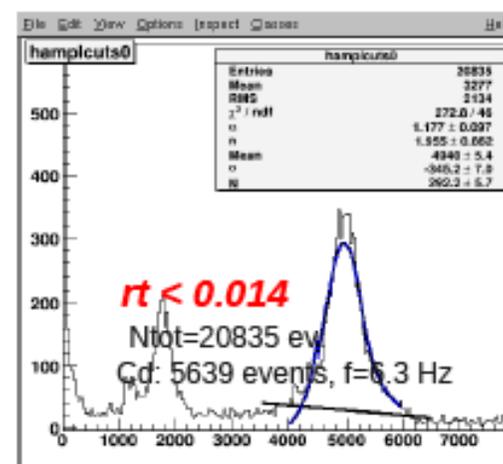

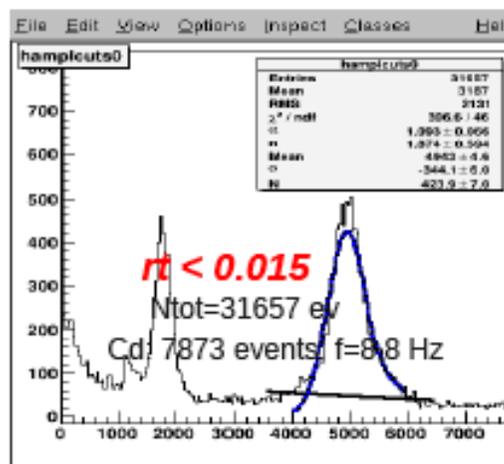

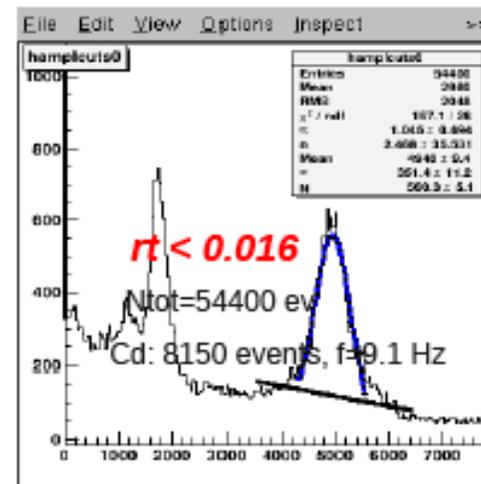

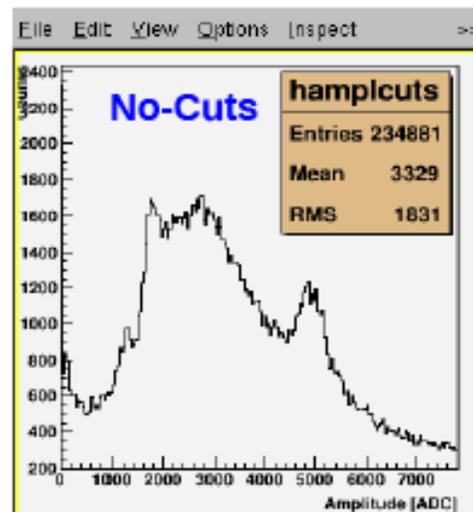

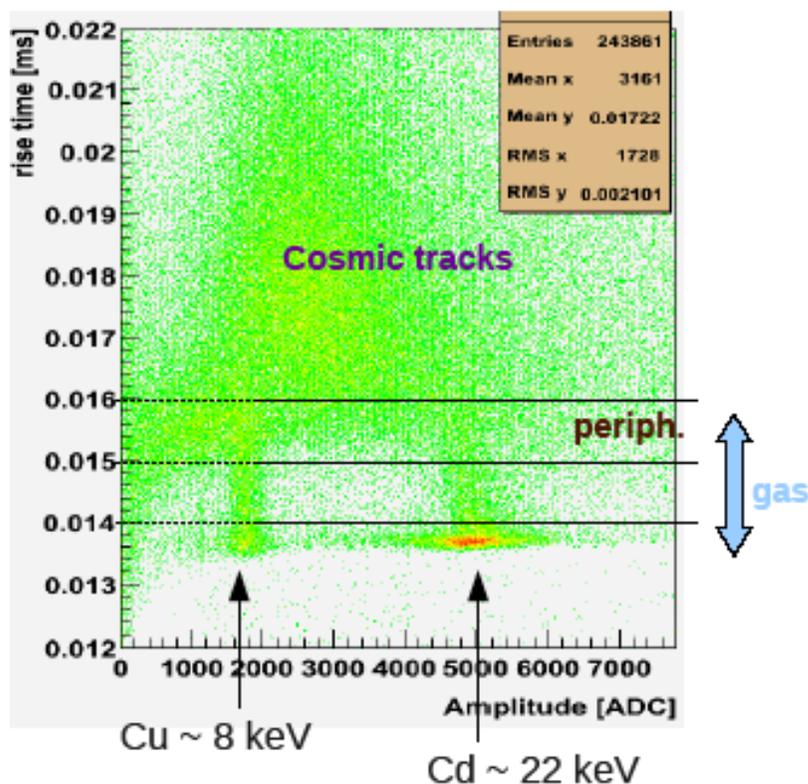

- Simple and cheap
- Large volume
- single read-out
- Robustness
- Good energy resolution
- Low energy threshold
- Efficient fiducial cut
- Low background capability

# Rejection power

## Rise time cut

Using Cd-109 source – December 2009  
 Irradiate gas through 200 $\mu$ m Al window  
 P = 100 mb, Ar-CH<sub>4</sub> (2%)

Efficiency of the cut in rt ==> ~ 70% signal (Cd peak)  
 Severe background reduction  
 Energy resolution ~ 6 % and 9 % for Cu and Cd

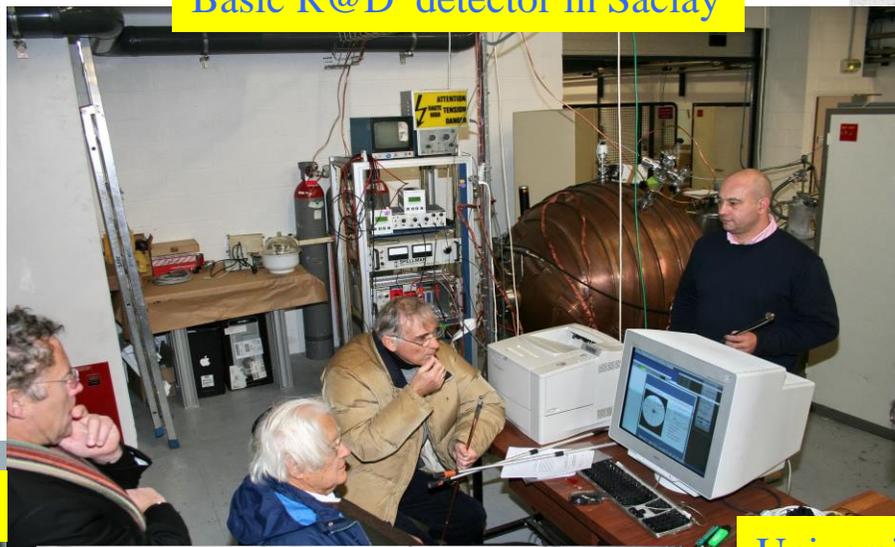

If  $rt \sim 0.0155$  ms ==>  $R = 65$  cm  
 0.014 ms ==> ~70% of signal

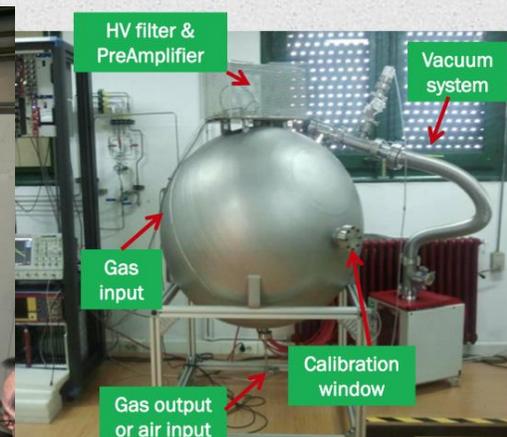

Low background detector  $d=60$  cm  $p=10$  bar

Basic R@D detector in Saclay

University of Saragoza detector

University of Thessaloniki detector

Queens University test sphere

University of Tsinghua - HEP detector

 $\mu\text{Bq/kg}$  :  $^{232}\text{Th}=1$ ,  $^{238}\text{U}=1$

milling

moulding

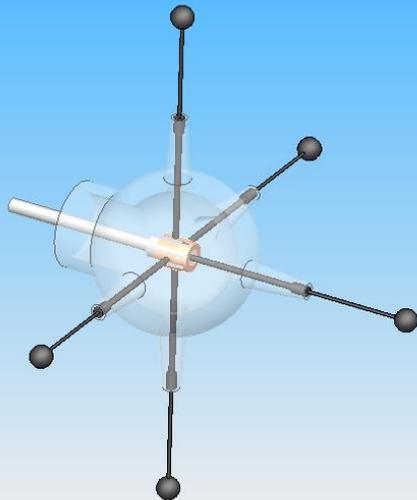

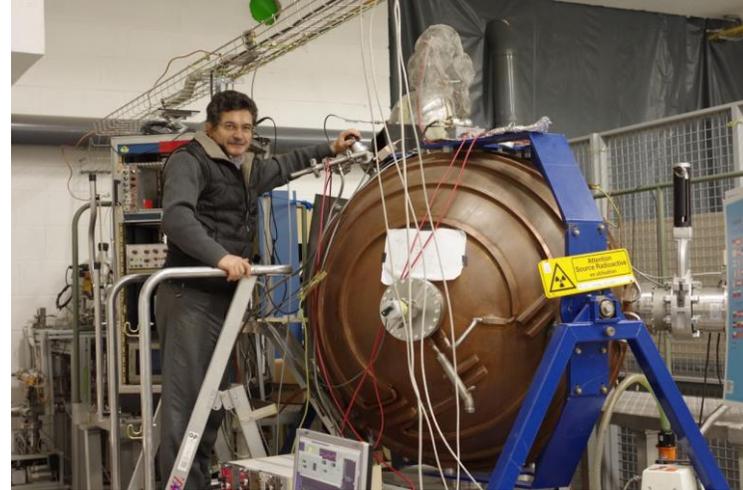

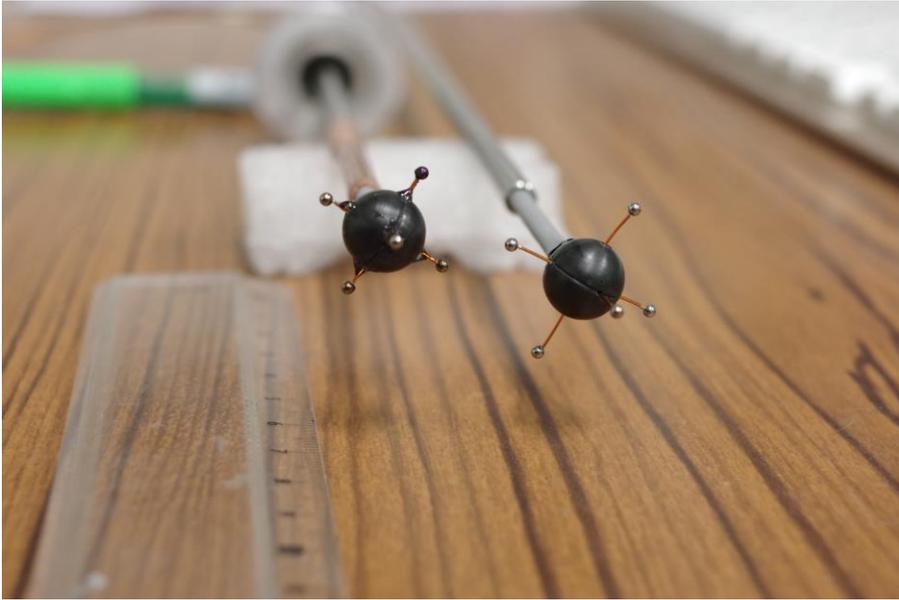

## Advantages

- Auto-shield
- Pressure up to 50 bar
- Low cost
- Faster process

# Multi-ball 'ACHINOS' structure

Developed in Saclay in collaboration with University of Thessaloniki

## Advantages

- Amplification tuned by the ball size: 1mm diameter for high pressure
- Volume electric field tuned by the size of the ACHINOS structure
- Detector segmentation

# Additional physics

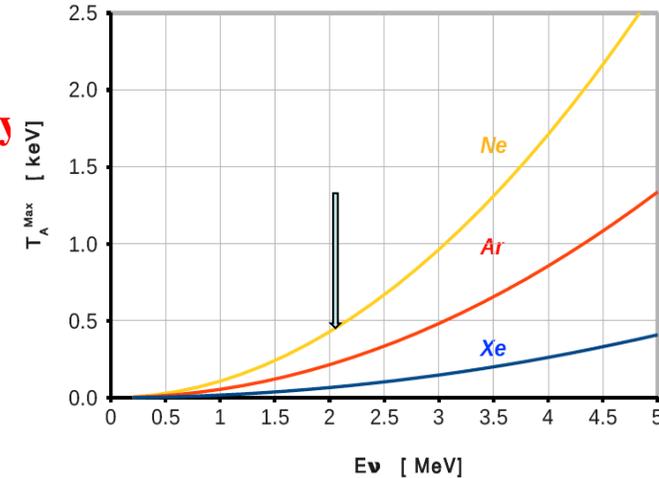

## Neutrino-nucleus coherent elastic scattering

$$\nu + N \rightarrow \nu + N \quad \sigma \approx N^2 E^2, \quad D. Z. Freedman, Phys. Rev.D,9(1389)1974$$

High cross section but very-low nuclear recoil

Illustration: using the present prototype at 10 m from the reactor, after 1 day

Detector threshold (electrons)	1	2	3	4
Xe	105	32	3	0
Ar	42	24	9	4
Ne	18	12	7	4

## A dedicated Supernova detector

Simple and cost effective - Life time  $\gg$  1 century

Through neutrino-nucleus coherent elastic scattering

*Y. Giomataris, J. D. Vergados, Phys.Lett.B634:23-29,2006*

Sensitivity for galactic explosion

For  $p=10$  Atm,  $R=2$ m,  $D=10$  kpc,  $U_\nu=0.5 \times 10^{53}$  ergs

# Number of events (after quenching,  $E_{\text{th}}=0.25$  keV)

He	Ne	Ar	Kr	Xe	Xe (with Nuc. F.F)
0.08	1.5	6.7	23.8	68.1	51.8

Idea : A world wide network of several of such dedicated Supernova detectors

To be managed by an international scientific consortium and operated by students

# Competitive double beta decay experiment with Xe-136 at 50bar

In collaboration with CNBG ( F. Piquemal et al.), CPPM (J. Busto et al.)

The goal is to reach a record low background level  $\ll 10^{-4}/\text{keV/Kg/y}$   
and an energy resolution of .3%

## Simulation model

*By J. Galan*

Sphere diameter: 2 m

Shield 30 cm copper

Xenon gas at 50 bar (1272 Kg)

Vessel Copper activity  $\mu\text{Bq/kg}$  :

Aurubis commercial  $^{232}\text{Th}= 1$ ,  $^{238}\text{U}= 1$

PNNL  $^{232}\text{Th}=.034$ ,  $^{238}\text{U}=.13$

Results are very encouraging:

Expected background rate in the region of  $Q_{\text{bb}}$  (2.46 MeV)

$8.\times 10^{-5}/\text{keV/Kg/ year}$  Arubis copper

$1.54\times 10^{-5}/\text{keV/Kg/ year}$  PNNL copper

(compared to  $2\times 10^{-3}/\text{keV/Kg/ year}$  of running experiments)

# If additional rejection is required: a new idea

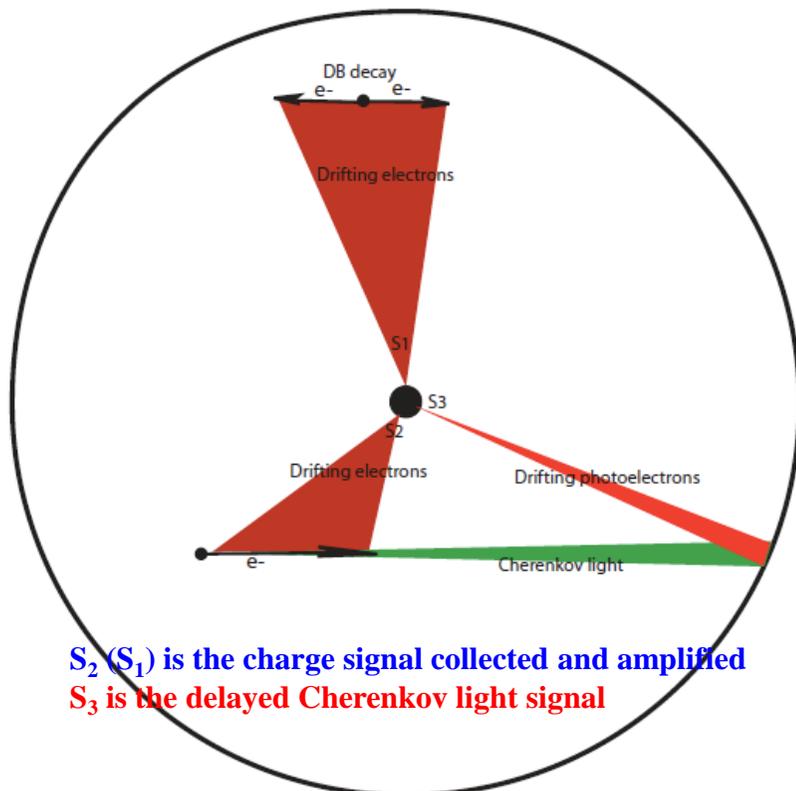

Background free double beta decay experiment, *I. Giomataris, J.Phys.Conf.Ser. 309 (2011) 012010*

The idea is to detect Cherenkov light emitted by two electrons and then reject background from single electrons (Compton scattering etc..)

Xenon-136 at high pressure of about 25-40 bar is ideal to keep high efficiency for double electrons, Good enough electron path and reduce multiple scattering

A simple read-out is the standard spherical detector signal combined with

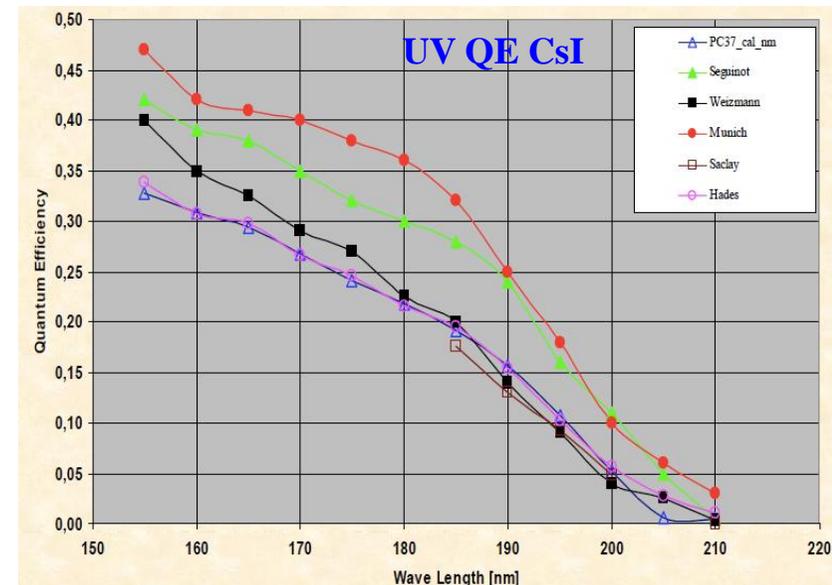

CsI photocathode layer deposited at the internal vessel surface, inducing a delayed signal

$S_2$  ( $S_1$ ) is the charge signal collected and amplified

$S_3$  is the delayed Cherenkov light signal

iomataris

# THANK YOU

## 8th SYMPOSIUM ON LARGE TPCs FOR LOW-ENERGY RARE EVENT DETECTION

The eighth international symposium on “large TPCs for low-energy rare event detection” will be held in Paris on the 5th-7th of December 2016.

The purpose of the meeting is an extensive discussion of present and future projects using a large TPC for low energy, low background detection of rare events (low-energy neutrinos, double beta decay, dark matter, solar axions).

In addition to the symposium, a half day workshop on neutrino from Supernova will complete this three-day symposium and will be the closing session just before the summary talk.
