Abstract. By means of pulsed laser spectroscopy applied to muonic hydrogen (μ^-p) we have measured the $2S_{1/2}^{F=1} - 2P_{3/2}^{F=2}$ transition frequency to be 49881.88(76) GHz [1]. By comparing this measurement with its theoretical prediction [2, 3, 4, 5, 6, 7] based on bound-state QED we have determined a proton radius value of $r_p = 0.84184(67)$ fm. This new value differs by 5.0 standard deviations from the CODATA value of 0.8768(69) fm [8], and 3 standard deviation from the e-p scattering results of 0.897(18) fm [9]. The observed discrepancy may arise from a computational mistake of the energy levels in μp or H, or a fundamental problem in bound-state QED, an unknown effect related to the proton or the muon, or an experimental error.

Lamb shift and hyperfine splitting (1)

Negative μ beams at PSI are stopped in H_2 gas target at 1 hPa and $20^\circ C$

A) Formation of μp atoms in highly excited states. 1% populates the 2S state ($\tau=1 \mu s$).

B) Laser excitation of 2S-2P transition

C) 2S and 2P energy levels.

ν_s and ν_p : measured transitions

$$\frac{1}{4}h\nu_s + \frac{3}{4}h\nu_t = \Delta E_L + 8.8123(2)\text{meV}$$

$$h\nu_s - h\nu_t = \Delta E_{\text{HFS}} - 3.2480(2)\text{meV}$$

$$\Delta E_L^{\text{exp}} = 202.3706(23) \text{ meV}$$

$$\Delta E_{\text{HFS}}^{\text{exp}} = 22.8089(51) \text{ meV}$$

Lamb shift and hyperfine splitting (1)

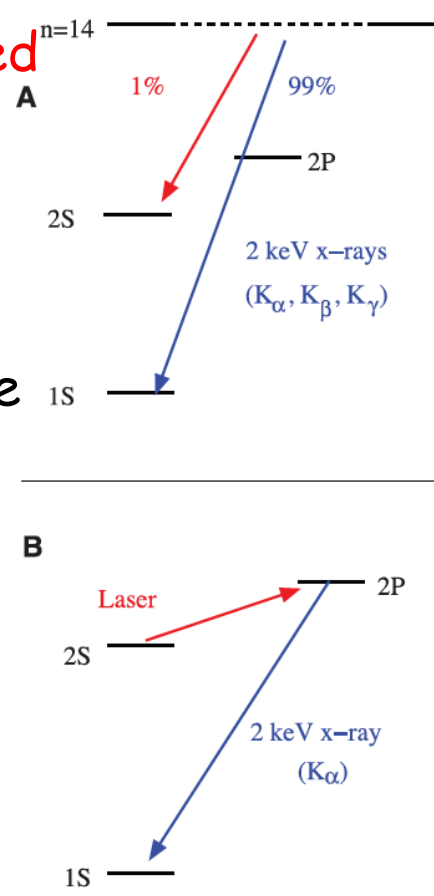

Negative μ beams at PSI are stopped in H_2 gas target at 1 hPa and $20^\circ C$

A) Formation of μp atoms in highly excited states. 1% populates the 2S state ($\tau=1 \mu s$).

B) Laser excitation of 2S-2P transition

C) 2S and 2P energy levels.

ν_s and ν_p : measured transitions

An electron in S state has some probability to be inside the proton.
 The electric field (charge distribution) is modified by the proton size.
 The ν_s and ν_p transitions are affected by the proton size (few %)

Lamb shift and hyperfine splitting

$$\Delta E_{\text{finite size}} = \frac{2\pi Z\alpha}{3} r_E^2 |\Psi(0)|^2$$

Atomic wave function at the origin

$$|\Psi(0)|^2 \approx m_r^3, m_r(\mu\text{p system}) \approx 186 m_e$$

H radius : 60000 x p radius

μH Bohr radius is ≈ 200 times smaller: larger sensitivity!

$$\frac{1}{4} h\nu_s + \frac{3}{4} h\nu_t = \Delta E_L + 8.8123(2) \text{ meV}$$

$$h\nu_s - h\nu_t = \Delta E_{\text{HFS}} - 3.2480(2) \text{ meV}$$

$$\Delta E_L^{\text{exp}} = 202.3706(23) \text{ meV}$$

$$\Delta E_{\text{HFS}}^{\text{exp}} = 22.8089(51) \text{ meV}$$

$$\Delta E_L^{\text{th}} = 206.0336(15) - 5.2275(10) r_E^2 + \Delta E_{\text{TPE}}$$

$$\Delta E_{\text{TPE}} = 0.0332(20) \text{ meV}$$

$$\begin{aligned} r_E &= 0.84087(26)^{\text{exp}}(29)^{\text{th}} \text{ fm} \\ &= 0.84087(39) \text{ fm} \end{aligned}$$

Abstract. By measuring the $1s$ Lamb shift of muonic hydrogen (μ^-p) we have determined the proton radius with a standard deviation 7% smaller than the CODATA-06 value. This measurement is in agreement with the e-p scattering data and differs by 5.0 standard deviations from the CODATA-06 value. The discrepancy may arise from a problem in bound-state QED, an unknown experimental error, or a new fundamental physics.

proton (μ^-p) we have measured the $1s$ Lamb shift [1]. By comparing our result with the CODATA-06 value we find that our value differs by 5.0 standard deviations from the CODATA-06 value. The discrepancy may arise from a problem in bound-state QED, an unknown experimental error, or a new fundamental physics.

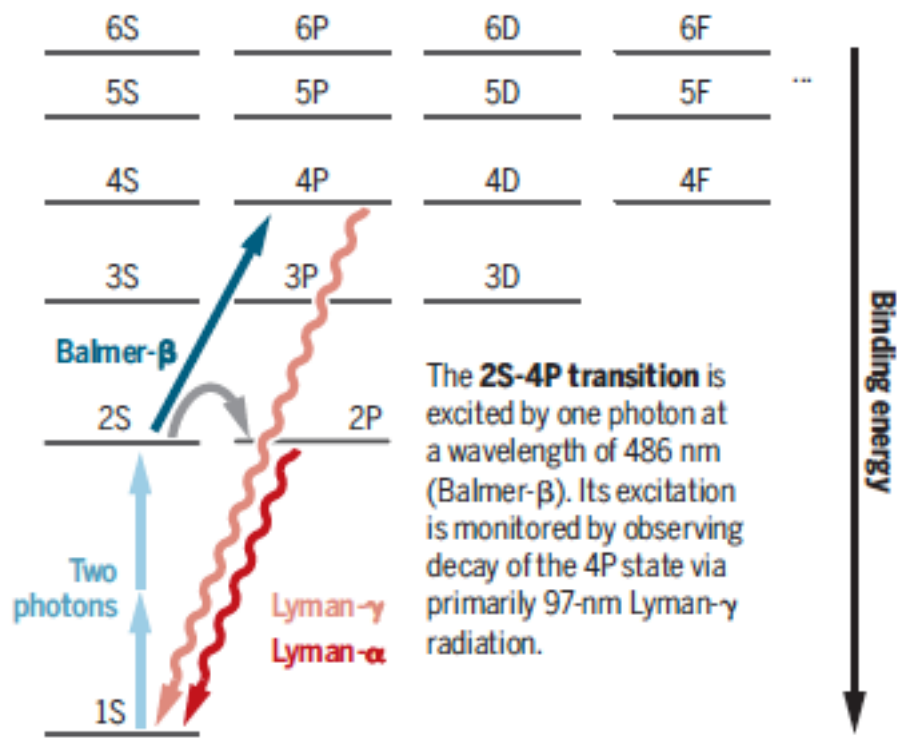

The proton radius revisited

We show that in previous analyses of electron-proton scattering, the uncertainties in the statistical procedure to extract the proton charge radius are underestimated. Using a fit function based on a conformal mapping, we can describe the scattering data with high precision and extract a radius value in agreement with the one obtained from muonic hydrogen.

Why I do not trust the fits

Slide from Savely Karshenboim

Why I do not trust the fits

Slide from Savely Karshenboim

$$\frac{G_E(q^2) - 1}{q^2}$$

Conclusions

- Discrepancy between the determination of the proton radius:
 - CODATA (ep scattering & H) and muonic hydrogen
 - ep elastic scattering and μH
 - Recent and previous Hydrogen Lamb shift experiments
 - Tension between analysis of ep-scattering: extrapolation to $Q^2=0$!!!

The problem is on derivatives, not on observables !

- Our contribution:
 - Very low transferred momenta can be reached by proton-electron elastic scattering (inverse kinematics)
 - Fully relativistic description of **proton-electron scattering** : kinematics, differential cross section, polarization phenomena and radiative corrections

The unpolarized cross section (I)

- *The matrix element*

$$\mathcal{M} = \frac{e^2}{k^2} j_\mu J_\mu,$$

- *The leptonic tensor*

$$j_\mu = \bar{u}(k_2) \gamma_\mu u(k_1),$$

- *The hadronic tensor*

$$\begin{aligned} J_\mu &= \bar{u}(p_2) \left[F_1(k^2) \gamma_\mu - \frac{1}{2M} F_2(k^2) \sigma_{\mu\nu} k_\nu \right] u(p_1) \\ &= \bar{u}(p_2) \left[G_M(k^2) \gamma_\mu - F_2(k^2) P_\mu \right] u(p_1). \end{aligned}$$

$$P_\mu = (p_1 + p_2)_\mu / (2M).$$

$$\begin{aligned} G_M(k^2) &= F_1(k^2) + F_2(k^2) \\ G_E(k^2) &= F_1(k^2) - \tau F_2(k^2) \end{aligned}$$

The transverse beam polarization induces effects smaller by M/E

Polarization transfer coefficients

- *Initial electron and final proton spin*

$$S \equiv (0, \vec{\xi}), \quad \eta_2 \equiv \left(\frac{1}{M} \vec{p}_2 \cdot \vec{S}_2, \vec{S}_2 + \frac{\vec{p}_2 (\vec{p}_2 \cdot \vec{S}_2)}{M(E_2 + M)} \right)$$

- *The polarized cross section*

$$\frac{d\sigma}{dk^2}(\vec{\xi}, \vec{S}_2) = \left(\frac{d\sigma}{dk^2} \right)_{un} [1 + T_{\ell\ell} \xi_\ell S_{2\ell} + T_{nn} \xi_n S_{2n} + T_{tt} \xi_t S_{2t} + T_{\ell t} \xi_\ell S_{2t} + T_{t\ell} \xi_t S_{2\ell}],$$

- *The coefficients*

$$DT(S, \eta_2) = 4mMG_M(k^2) [G_E(k^2)(k \cdot S k \cdot \eta_2 - k^2 S \cdot \eta_2) - k^2 F_2(k^2) P \cdot S P \cdot \eta_2]$$

Polarization transfer coefficients

$$p + \vec{e} \rightarrow \vec{p} + e$$

$$\theta_e = 30 \text{ mrad}$$

$$\theta_e = 10 \text{ mrad}$$

$$\theta_e = 0$$

$$\theta_e = 50 \text{ mrad}$$

Polarization correlation coefficients

- *Initial electron and proton spins*

$$S \equiv (0, \vec{\xi}), \quad \eta_1 = \left(\frac{\vec{p} \cdot \vec{S}_1}{M}, \vec{S}_1 + \frac{\vec{p}(\vec{p} \cdot \vec{S}_1)}{M(E + M)} \right)$$

- *The polarized cross section*

$$\frac{d\sigma}{dk^2}(\vec{\xi}, \vec{S}_1) = \left(\frac{d\sigma}{dk^2} \right)_{un} [1 + C_{ee}\xi_e S_{1e} + C_{tt}\xi_t S_{1t} + C_{nn}\xi_n S_{1n} + C_{et}\xi_e S_{1t} + C_{te}\xi_t S_{1e}],$$

- *The coefficients*

$$DC(S, \eta_1) = 8mMG_M(k^2) [(k \cdot S k \cdot \eta_1 - k^2 S \cdot \eta_1)G_E(k^2) + \tau k \cdot \eta_1 (k \cdot S + 2p_1 \cdot S)F_2(k^2)].$$

Spin correlation coefficients

$$\vec{p} + \vec{e} \rightarrow p + e$$

$$\theta_e = 30 \text{ mrad}$$

$$\theta_e = 10 \text{ mrad}$$

$$\theta_e = 0$$

$$\theta_e = 50 \text{ mrad}$$

Polarization by Spin Flip?

Ongoing experiments:

Spin Filtering with polarized targets

Spin Filtering with antiprotons at AD (CERN)

Our contribution to this problem:
large polarization effects appear at large energies.

Figure of Merit

$$\mathcal{F}^2(\theta_p) = \epsilon(\theta_p) A_{ij}^2(\theta_p), \quad \epsilon(\theta_p) = N_f(\theta_p)/N_i$$

$$\left(\frac{\Delta P(\theta_p)}{P} \right)^2 = \frac{2}{N_i(\theta_p) \mathcal{F}^2(\theta_p) P^2} = \frac{2}{L t_m (d\sigma/d\Omega) d\Omega A_{ij}^2(\theta_p) P^2},$$

$$\vec{p} + \vec{e} \rightarrow p + e$$

$$\theta_e = 30 \text{ mrad}$$

$$\theta_e = 10 \text{ mrad}$$

$$\theta_e = 0$$

$$\theta_e = 50 \text{ mrad}$$

Polarimetry

*Polarized beam
on polarized target*

$$F^2 = \int \frac{d\sigma}{dk^2} A_{ij}^2(k^2) dk^2$$

F^2 Max at $E \sim 10$ GeV

$L = 10^{32} \text{ cm}^{-2} \text{ s}^{-1}$

$N_{\text{beam}} = 6 \times 10^{17} \text{ p s}^{-1}$

$N_{\text{target}} = 2 \times 10^{14} \text{ atomes/cm}^2$

$\Delta P = 1\%$ in $t = 3\text{m}$

Radiative corrections to elastic proton-electron scattering measured in coincidence

G. I. Gakh, M. I. Konchatnij, N. P. Merenkov, and E. Tomasi-Gustafsson
 Phys. Rev. C **95**, 055207 – Published 30 May 2017

Soft Radiative Corrections (α^3)
 Hard Radiative Corrections

Soft Radiative Corrections (α^3)

$$d\sigma^{(RC)} = (1 + \delta_1 + \delta_2 + \delta^{(s)} + \delta^{(\text{vac})})d\sigma^{(B)} = (1 + \delta_0 + \bar{\delta} + \delta^{(\text{vac})})d\sigma^{(B)},$$

$$\delta_0 = \frac{2\alpha}{\pi} \ln \frac{\bar{\omega}}{m} \left[\frac{\epsilon_2}{k_2} \ln \left(\frac{\epsilon_2 + k_2}{m} \right) - 1 \right],$$

$$\bar{\delta} = \frac{\alpha}{\pi} \left\{ -1 - 2 \ln 2 + \frac{\epsilon_2}{k_2} \left[\ln \left(\frac{\epsilon_2 + k_2}{m} \right) \left(1 + \ln \left(\frac{\epsilon_2 + k_2}{m} \right) + 2 \ln \left(\frac{m}{k_2} \right) + \frac{m + 3\epsilon_2}{2\epsilon_2} - \right. \right. \right. \\ \left. \left. \left. - \ln \left(\frac{\epsilon_2 + m}{k_2} \right) - \frac{1}{2} \ln \left(\frac{Q^2}{m^2} \right) \right) + 4m \frac{M^2 q^2}{\epsilon_2 \mathcal{D}} \ln \left(\frac{\epsilon_2 + k_2}{m} \right) (G_E^2 - 2\tau G_M^2) - \right. \right. \\ \left. \left. - \frac{\pi^2}{6} + Li_2 \left(\frac{\epsilon_2 - k_2}{\epsilon_2 + k_2} \right) + Li_2 \left(\frac{\epsilon_2 + k_2 + m}{2(\epsilon_2 + m)} \right) - Li_2 \left(\frac{\epsilon_2 - k_2 + m}{2(\epsilon_2 + m)} \right) \right] \right\}.$$

$$\delta^{(\text{vac})} = \frac{2\alpha}{3\pi} \left\{ -\frac{5}{3} + 4 \frac{m^2}{Q^2} + (1 - 2 \frac{m^2}{Q^2}) \sqrt{1 + 4 \frac{m^2}{Q^2}} \ln \frac{\sqrt{1 + 4 \frac{m^2}{Q^2}} + 1}{\sqrt{1 + 4 \frac{m^2}{Q^2}} - 1} \right\}.$$

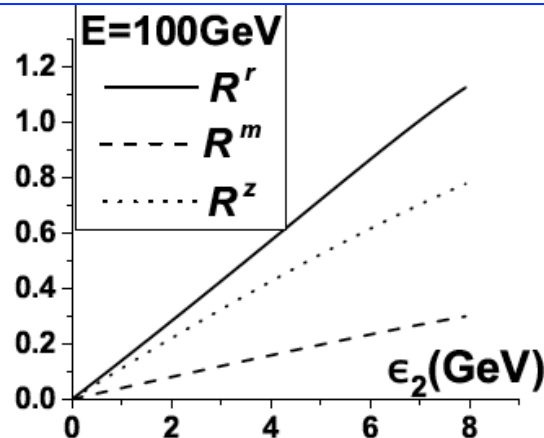

Cross section and FFs

Born cross section with dipole FFs

$$R^r = 1 - \frac{d\sigma^r}{d\sigma^{sd}}, \quad R^m = 1 - \frac{d\sigma^m}{d\sigma^{sd}}, \quad R^z = 1 - \frac{d\sigma^z}{d\sigma^{sd}},$$

Hard Radiative Corrections (α^3)

Maximum energy of the hard photon
Emitted in the whole solid angle

Kinematically allowed region
- for proton (E_2) and
- electron (ϵ_2) energy

$$\bar{y} = [(m - \epsilon_2)(E - \epsilon_2 - \omega) + \sqrt{\epsilon_2^2 - m^2} \sqrt{(E + m - \epsilon_2 - \omega)^2 - M^2}] / \omega.$$

$$y_{\pm} = E \pm p,$$

total

Change sign!

Sensitivity of RC to FFs

$$P^i = \frac{1 + \delta_{\text{tot}}^i}{1 + \delta_{\text{tot}}} - 1, \quad i = r, m,$$

δ_{tot} : RC for dipole parametrization

Application

Precise measurement of the proton radius

The SPIN of the proton

$$S = 1/2$$

$$\Delta\Sigma + \Delta G + L$$

Quarks

gluons

orbital momentum

Measured: $\sim 1/4$

And if ...
a proof of quark substructure?

RC : what we learned

- The *sensitivity* of the cross section to FFs *grows with proton beam energy*
- The *hard photon correction* depends on the *uncertainty in the energy* of the scattered particles
- *Strong cancellation* between the *positive hard correction* and the *negative virtual and soft*: at $E=100$ GeV $\delta s \sim \delta h \sim 20\%$, but the sum $\delta \sim 6\%$
- Taking into account the proton structure does not change essentially the estimation at so small Q^2
- *Two photon exchange is $\sim 0.1\%$*
- **Model independent radiative corrections for *pe* elastic scattering have been calculated for a cross section measured at permille accuracy.**
- Model dependent corrections are small and can not affect the cross section
